"Blakeman has fruited for two years and produces fruit of good quality, from a pound to a pound and a half, maturing in January and February. Dickey (Habersham) is a good grower, productive, of good size, quality and appearance. Lyon has so far shown an exaggeration of the faults it has in California and what fruit has been produced generally cracked before maturity.

Parent Tree of the Fuerte Avocado

During the last five years the Fuerte avocado, originally introduced into the United States in 1911 from Atlixco, Puebla, Mexico, has come to the front as one of the most promising commercial varieties in this country. It is remarkable in that it is apparently a hybrid between the Guatemalan and Mexican races. This illustration shows the parent seedling tree growing in the garden of Alejandro Le Blanc in Atlixco. The tree is believed to be about 60 years old, and it produces about 500 fruits annually. Photographed by Wilson Popenoe, Atlixco, State of Puebla, Mexico, December 22, 1918. Used by courtesy of U. S. Department of Agriculture.

"Fuerte has shown itself universally an excellent, thrifty grower and generally a good bearer. Spinks is a vigorous grower and promises to be prolific, size about 25 ounces and quality good. Linda has produced some specimens weighing 36 ounces of excellent quality, tree a good grower. Taft has given quite general satisfaction, is of superior quality and medium size. Wagner, quality good, bears freely of fruits about 22 ounces."

Marketing Avocados

A. F. Yaggy, Santa Barbara, writes: "At a time like this, when sugar jumps $5 a hundred over night and food staples sell at the price of luxuries, it is no wonder that good sized avocados have retailed as high as $2 each. It is no wonder, either, that certain of our members express the opinion that at the present time the association need not seriously consider the question of marketing; that the trade is calling for avocados faster than they can supply them.

"In former discussions of marketing the grim specter of overproduction haunted the meetings, but as the years roll by the good angel, Increased Demand, has proven more than a match for him, and from the way prices have risen we can all easily believe that it is perfectly possible to send a skyrocket to the moon. Just when this bubble of wild extravagance will burst and things will settle down to something like real values no one can say, but whether that time comes in one year or five, we can be reasonably sure that things classified as luxuries, such as fruit selling at $2 a pound, will be the first to go begging. In the meantime many small plantings and a few larger ones are getting to the productive stage and nursery stock is in great demand.

"Of course, the law of supply and demand will regulate the price, as has been pointed out at every meeting of the association. We know that the supply is bound to increase rapidly and we are all so imbued with the great virtues of this fruit that we believe the public will share our enthusiasm and keep shouting for more, regardless of price. I think sales direct from grower to consumer is not the correct way. I think the Avocado Association should form a marketing place in Los Angeles where the growers could take or ship fruit and receive a price per pound, such price to be determined by the board of di-

Treating Frosted Walnut Trees

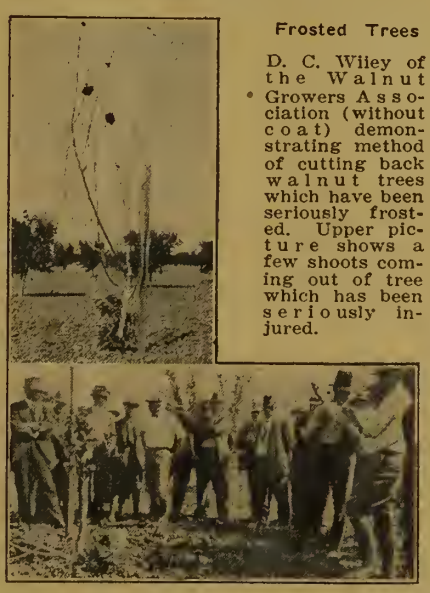
By Ernest Braunton

THE unusually heavy frosts during the first week in November, 1919, found many fruit and nut trees of the deciduous class most persistent in the retention of foliage and vitality, and they were either killed or badly injured, being full of immature sap.

This damage was not apparent during autumn and winter, but is painfully manifest to the orchardist in spring when such trees refuse to leaf out. Among young trees few were killed; in some orchards few were injured, while in other sections every tree in a considerable acreage was badly injured. In older orchards no trees were killed, but damage ranged from almost nothing to the killing of wood two years old.

As so much difference of opinion prevails as to why one orchard or one tree is immune, while others are not, the Los Angeles County farm bureau held four meetings on May 24 in the Van Nuys-Owensmouth-Zelzah section of the San Fernando Valley, to discuss the subject with the growers, inform them of results of late experiments and demonstrate the best methods of treatment of frost damaged trees. After introductory talks by Farm Adviser Hodgson and Secretary Rosecrans, Dr. L. D. Batchelor of the Riverside experiment station addressed the first of the meetings, at the Grimes ranch, Van Nuys, and D. C. Wylie, manager field department of the Walnut Growers Association, demonstrated pruning methods in the orchard. Dr. Batchelor spoke substantially as follows:

"This injury to walnut trees is an old story with us and must not be viewed as a calamity for which no remedy is known. We have been investigating it for five or six years. It is a trouble that has been experienced in nearly all walnut sections. It merely constitutes a more or less serious setback and trees badly injured have been brought back to perfect form and vigor. It is only necessary to give these trees an intelligent pruning and so treat them in years to come that they may be more or less resistant to further injury.



Frosted Trees

D. C. Wiley of the Walnut Growers Association (without coat) demonstrating method of cutting back walnut trees which have been seriously frosted. Upper picture shows a few shoots coming out of tree which has been seriously injured.

Causes of Injury

"The damage wrought may fall within one of four classes or causes: 1. Frost injury to young trees that remain active late in the fall and are caught in full leaf by early autumn frosts. Warm, sunny weather may follow, the leaves fall, the twigs dry quickly and older wood may become badly sunburned on top or south sides. 2. Lack of soil moisture in fall. Even well ripened trees will take a little soil moisture. The same spring appearance will occur as with frost damaged trees unless drouth kills old wood, even to four or five years growth, and occasionally the whole tree, while frost kills but wood one or two years old. 3. High water table. Too much water at the roots so trees cannot mature season's growth, which should become properly cured in early autumn. 4. Alkali salts. A common and extending cause. Leaves usually dry and fall early in August or September, and may leaf out again in October and be caught by frosts as in class number one. Trees may die back for three or four years growth. This class of injury is most common in the older orchards. There is a fifth cause of die back, but rare—sunburn in summer from unusually hot weather.

The Local Problem

"In the local walnut section all the damage may doubtless be ascribed to cause number one—early frosts. The first week in November we experienced similar trouble in trial plots at Hemet, where we had young trees kept growing, while in checks plots having ripened wood little or no damage was done. We have, therefore, created the same conditions you have here. As to remedy: The root system has in no wise been injured and you may build a new tree upon it from a strong new shoot as easily as the nurseryman grew it in the first instance, so long as the shoot appears above the graft.

"Trees little injured are easily shaped, and no case is hopeless where a single green shoot appears. The damage is easily and quickly repaired. Cut back the old growth down to live wood on all trees. If this is high enough, leave several branches, but if low on the young trunk, cut to a strong shoot, preferably on the windward side, and leave but this one. If stakes are present, always cut in this way, but if no stakes are present you may leave the old trunk to tie to for the first year, removing all but the main shoot that is to form the new tree. Do not head or top this the first year, even though the tip may get frosted. If you cut it off, laterals may start out that are still more tender and may be seriously frozen.

Irrigation Practice

"In local sections irrigation should doubtless not be given after the first week in August. With young trees it is better not to wet down more than two feet at that time. There is no hard and fast rule, but this gives you September and October in which to harden trees. The sap thickens and a greater degree of cold is then necessary to wreak damage. After this hardening, if fall is dry, one should irrigate from November 1 to January, as the season requires.

"The Placentia generally matures earlier than the Eureka and starts earlier in spring. The Erhardt is a good variety so far as observed, but is not sufficiently known to warrant specific recommendation. The Franquette is very hardy but is a failure locally, so far as crop performance is concerned. Irrigation is necessary to all orchards, and about three during summer is the general practice—in June, July, and August."

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

A NEW PARTY

We have an invitation to attend "The National Convention of the Committee of Forty-eight" at Chicago, July 10, 12 and 13, to form a new political party.

We have cordial appreciation of the invitation, but must decline. We all have trouble enough now with two parties offering all kinds of inducements. "We are witnessing a silent and ominous revolution in our national life." May be true. Still we believe if we will all get busy with the parties now in existence we may accomplishe more and with less of the dizziness which comes from perpetual revolution.

GAS SHORTAGE

With the increase of power on farms, with greater demand than ever in the industries, with the vast increase in the number of pleasure autos, comes the word that production of gasoline and distillates is slightly under normal. This has somewhat frightened us all and has given the pessimist occasion to make claims as to ultimate reduction or exhaustion of the oil supply.

This has been claimed to be a false alarm by many of the more optimistic. Old Mother Earth has not failed us and she will yet yield many millions of gallons of gasoline. Meantime, wiser heads are advising investigations as to manufactured power. It has been found that sawdust, vegetable fibers and many other substances, even a bucket of water, offer unlimited power possibilities. The chemist observes that if we will but decompose the water and secure the hydrogen and the oxygen we may combine them again and secure the most powerful mixture of gases known. "All that is needed is simply to decompose the water."

STILL WORTH WHILE

"If a man with pick and shovel or with mortar hod can earn $6 or possibly $10 per day while one in a profession or calling requiring highest education receives only $1,500 or $2,000 per year, why should we strive for education?"

The Cultivator has no particular wisdom to offer in answer to this question. Perhaps we must admit that education is generally figured in dollars and cents. Perhaps it must be if we have the American commercial spirit. It appears to us that there is a higher satisfaction in the personal attainment, still more in fitting ourselves to be of greatest service to our community and to our country.

But, bringing it back to the dollars and cents standpoint: "Mere strength and awkwardness will not always command the premium which it does today; the earth will return to normal conditions ultimately, and by the time the education now being sought is secured, there will be occasion for its use. Bear in mind no business is successful without sufficient capital, and the capital which moves the earth is intellectual capital."

TRUCKS—GOOD ROADS

Several counties of the state are taking steps to enforce regulations against heavy trucking over their good roads. Especially is the farm bureau active in the campaign. In Orange County the farm bureau in formal resolutions has called attention to the excessive rate of speed which heavily loaded trucks maintain and declares that "if said practice is not at once checked or stopped it will result in total destruction of the paved highways, therefore, be it resolved that it is the sense of the Orange County farm bureau and each and all of its members that the provisions as to the loads hauled or driven on or over the highways of Orange County and the speed at which said loads are hauled or driven should be rigidly enforced, and that we herewith demand of our board of supervisors the enforcement of said provisions of said ordinance, even to the extent of employing, if necessary, an inspector, or inspectors, who shall be authorized and empowered to demand and enforce the weighing of any load or loads moved over said highways, and if necessary to have said load or loads reduced in weight to conform to the provisions of said ordinance."

SAVING THE WASTES

Professor Cruess' article makes most attractive reading for the housewife and in fact for all of us, in that it is another suggestion leading to saving of the wastes, and in the saving of wastes there is sometimes 100 per cent of the profits of some large industries. The article not only tells how our lower grade fruits may be combined with sugar and made into most attractive preserves, jellies and jams, but how the fruit may be made to take the place of sugar which is needed by every normal human. And sugar's 500 per cent increase is a feature of the H. C. L.

Dealing even more exclusively in waste products are other concerns like the one at Corona referred to on first cover page. This describes a citric acid plant on the El Cerrito Ranch, where hundreds of tons of lemons are manufactured into a few hundred pounds of a product of high value.

Then California has her marmalade factories, cider mills, skimmed milk evaporators, fruit, potato, vegetable and other evaporators, all saving wastes or low grade products. Yet they are only one-tenth of enough to save all the wastes.

Investigators and practical workers are bringing about a condition which will add much to the profits secured in California.

WAR BONUS

No country ever had a more united people than did America when once it decided to go to war. We wondered at ourselves, that we were able in a little over a year to put a couple of million men in the fighting front and have in training another two millions ready to go and even going every day. But still more wonderful was the fact that there were "in service" 100,000,000 of true Americans. To the few was given the honor to represent the great majority, but their service was no more willingly rendered than was that of those who stayed at home and wrought or produced as best they could. Some of those who did go across the water did not come back; others came bearing marks of injury which will incapacitate them for life. These men and dependents should never be allowed to suffer, and the history of this nation will give reassurance that the veterans of the world's greatest war will not be compelled to suffer because of its forgetfulness.

Most thorough vocational training, together with hospital service, is being rendered and will be continued, but the feeling is gathering force in all sections of the country that general and indiscriminate distribution of a cash bonus is not called for and, on the part of many men who were in the service, "tends to lessen the inspiration and debase the motive of national service." The caring for those who are incapacitated or for their dependents does not in any sense become a charity; it is simply the thoughtfulness of a great nation in caring for those who have been true to it.

MORE SUGAR PER ACRE

Mr. Shamel is back from the Hawiians. Mr. Shamel never goes anywhere without two perfectly good eyes, and they see a great deal. In the Hawaiians he saw fields, 200,000 acres of which produced something like 600,000 tons of sugar per year. He also saw that those 200,000 acres should produce 1,200,000 tons of sugar per year. In fact, the Hawaiian Sugar Planters Association realized that much of their problem before Mr. Shamel was called upon for help. The managers of the association, or rather of its experiment station, knew of Mr. Shamel's work with tobacco of the South, with corn of the Middle West, with the citrus of California, and they said: "Perhaps he will have equally practical suggestions for sugar and pineapple planters of the Hawaiian Islands." He went and told them—in fact, proved to them by actual experiment—what they knew but did not fully realize—"Like breeds like."

During all these years of growing sugar in the Hawaiian Islands the "seed cuttings" have been chosen indiscriminately. Mr. Shamel chose cuttings from the largest and most thrifty stools showing greatest number of large stalks with high percentage of sugar. Again, he chose from parent plants producing small canes, perhaps only one partially developed, or two or three, or again, one large husky cane with others of indifferent growth. These were planted and invariably produced their like.

The problems confronting the sugar grower are not quite so simple and quickly solved as the hint above may suggest, but Mr. Shamel's three months in the Hawaiians were sufficient to aid those islands to produce a far greater quantity of sugar. This year the returns will not be as great as had been expected. The strike of the Japanese laborers resulted in a tie-up at a critical time, so the planting will not be up to normal.

Practically one-half of the sugar is produced on the island of Oahu. This is practically under irrigation. Forty per cent is from the island of Hawaii and ten per cent from Maui.

TRUTH IN FABRIC

"All wool" fabric may be all wool and still be inferior stuff. Virgin wool may constitute only a part of the material, for 'shoddy' (old wool rags) is proving very attractive as to cost so the manufacturer economizes and we pay the price. Increase in use of shoddy is indicated by the following:

"More than 1,265,000,000 pounds of virgin wool have accumulated in the storehouses of the world since the beginning of the world war, according to statistics compiled by the National Sheep and Wool Bureau of America. When the world's wool clip of 1920 is completed a few weeks hence this amount will be increased by 2,500,000,000 pounds it is expected. In spite of the high price of wool fabrics the storehouses of America alone contained 700,000,000 pounds of virgin wool last September, ten months after the signing of the armistice, or 100,000,000 pounds more than the country's annual consumption.

"Even the most honest retailers are unable to detect the presence of shoddy in 'all wool' goods, because shoddy is all wool. The purchaser buys his 'all wool' clothing without knowing that he is getting old rags respun, and pays virgin wool prices.

"The Truth in Fabric bill, when enacted into law, will make the manufacturers come out in the open and tell what their goods are made of. Then people who want virgin wool and are ready to pay for virgin wool can get honest cloth, and goods made of shoddy will take its rightful place and price and can no longer masquerade made as virgin wool."

The Truth in Fabric bill was introduced in the house of representatives on January 7 by Congressman Burton L. French. Its number is 11641. John J. Esch is chairman of the interstate committee of the house. Senator Arthur Capper of Kansas introduced the bill into the senate, where its number is S-3686. The chairman of the interstate commerce committee is Albert B. Cummins.

All the farmer asks is that the manufacturer be compelled to tell the truth. The public demand will then soon correct the situation created by oversupply of virgin wool in storage

Copyright 1920, by The Goodyear Tire & Rubber Co.

"We haul local growers' fruits and delicate vegetables, such as lettuce, on pneumatics—Goodyear Cord Tires—because they are marketed in better condition this way and buyers give first choice to produce so protected. Our Goodyear Cord Tires run everywhere in cultivated fields and in a sandy orchard and deliver mileages to 15,000."—C. C. McIntosh, of McIntosh & Andru, Truckmen, Palmetto, Florida

As statements like this make apparent, more and more farmers are preventing the bruising of fruit, mutilation of delicate vegetables and much shrinkage in livestock by hauling on Goodyear Cord Tires.

In this way they reverse the situation that existed when solid-tired trucks or wagons were used with a resulting loss in crops, stock weight and general income due to slow, jarring transport.

On the resilient Goodyear Cord Tires a farm truck delivers smoothly and quickly, safeguarding the original condition of the load so as to secure the best prices for it.

The able pneumatics thus become important factors in the marketing of perishable produce and carefully fattened animals, as well as in practically all the work of raising and handling on and off the farm.

The excellent and often unusual mileages obtained from these tires attest the toughness of Goodyear Cord construction developed with that extraordinary manufacturing carefulness which protects our good name.

Farmers' records, detailing how pneumatics assist crop moving, motorization, chores and other activities, can be obtained by mail from The Goodyear Tire & Rubber Company, Akron, Ohio.

GOODYEAR CORD TIRES

Success of Long Pruning

By Ernest Braunton

THE Los Angeles County farm hureau held some pruning demonstrations in the San Fernando Valley, May 27, that were of unusual interest. The first was on the ranch of J. C. Craig. Here there were, three years ago, some large apricot trees so low in fruit production that it was decided to remove them, though they were fine, vigorous shade trees. They had always been headed back vigorously each year, made splendid growth but bore little fruit.

Mr. Craig was persuaded to try the new long pruning method on one-half of the trees, pruning the others as before. The results were nothing less than startling. A good crop came the first year, more the next year, and now, third year, two-thirds of the crop should be knocked off; the trees are much overloaded. The "headed back" trees are comparatively barren. On one of the long pruned trees the writer counted the fruits on the first branch he came in contact with as he approached the tree. Said branch was about three-fourths of an inch thick and four feet long. It contained 119 apricots of good size. One-half the number would have been too many.

A Record Crop

Next those interested visited the orchard of Chas. B. Sexsmith, across the road. Here is the finest seven year old orchard the writer has seen, loaded with a crop that cannot be mentally grasped without seeing it. Mr. Sexsmith, too, thought little of his trees, for the yield was light and he anticipated making a change. After seeing a tree long pruned and hearing the argument in favor thereof, he concluded to so prune one-half of his trees. Of course the next year all were so pruned.

Last year, the second year of long pruning, the orchard yielded five tons to the acre; this year it is expected to almost double that yield. Mr. Sexsmith told the writer some of the trees will yield over 500 pounds and all will average more than 400 pounds each. Had he long pruned his trees from planting he would have had a like yield at five years instead of seven. Every visitor, nearly all being apricot growers, was most enthusiastic over results, and all are strong advocates of the new pruning method, which alone brings maximum results.

Long Pruning Method

Artemus Ward wrote: "I dont kare what a man sez, so long as he sez it in a phew words." Boiled down, this new system is: do not top or head back, but thin, thin, thin. Also every fruit tree naturally forms at least twice as many leaders as it should have, and this number must be reduced, being careful to keep the center open. These are the "phew" words given the writer by Dr. J. C. Whittien, professor of pomology at the Universitl of California. But we will hear Dr. Whitten's story, told to the assemblage, as nearly as the writer can re-tell it.

"Years ago, while at the University of Missouri, I taught my students the same old heheading or topping system which we all thought was right. It is strange that light came, not through crop investigations, but through study of frost injury. To be short, a peach grower reported an unpruned tree had passed through a hard winter unharmed; the pruned trees were injured. It was found the trees with the longest and most vigorous upright shoots, the result of heading back, were most damaged—the juice was thinnest, most watery. On the unpruned tree the thin, short pendant twigs, especially on the lower part of the tree, were unharmed, and in season bore enormously. The growth was finished and the sap thick and rich with sugar.

The Young Tree

"The first year cut the young whip off at 30 inches above the soil. Allow about three branches to grow (four are admissable), one near the top, another six inches below and the third six inches still lower, all three well distributed around the tree, the lower one on the sunny side if possible. This is the ideal tree. Not all make an ideal start, hut vary this first year's training as little as you can.

"The second year leave these three leaders unpruned, but snip off the ends of all other shoots so they will have four or five leaves to shade trunk, elahorate the sap and become the first food storers and probably the first fruit bearers. Each of the three leaders should he allowed to hranch into two each, making six leaders from which to build the tree. The tree so built will bear less fruit the first or second fruiting year, but after that crops will far outrank those obtained through any other method of pruning.

"Keep the trees well thinned and the centers open. The best way to stop head growth or rank upright shoots is not to head or cut them off. Let them shoot up. At the end of the first year length growth largely stops, but little being made in subsequent years. Laterals will spring forth and give a tree well furnished with small wiry drooping branches. Trees so trained have a larger root system and a greater trunk diameter than "beheaded" trees. By keeping top well thinned we huild a larger food factory, for only finished thick, leathery, dark colored leaves manufacture plant food. The tree comes from the air. Burn the green wood and 97 per cent goes hack into the air; hut three per cent of ash remains, the mineral part that comes from the soil. Therefore huild from the air—in all parts of the tree.

"The top thin leaves on rank growing tips evaporate ten times as much as the finished thick dark leaves. They really spend more than they store and rob the tree of some of the food manufactured by the lower leaves. They waste water, build nothing. Like the spendthrift they are prodigal while the bank account is good but the first to show distress when hard times come. Just now, in May, cut back ends of small limbs if they too much hang over the center of fruiting branches, merely to let in light and air. Next year these shortened hranchlets will put out laterals that hear fruits. Never cut back heavy wood hut pinch back young twigs to six inches long. While main leaders and framework are upright the fruiting branches of all sizes should be drooping. The sap does not rush to the ends in drooping branches as it does in upright ones. A heavy crop or heavy pull on an upright shoot will break it off as the pull is lateral or sidewise. On a drooping branch the pull is lengthwise."

The charge was at first made that trees pruned by the Whitten method would run to top and the heaviest crop would be there, hut the contrary has proven to be the present condition. The upright growth is but little each year because the trees are so well thinned that laterals put out everywhere and fruit is everywhere, a wonderful distribution. He so encourages short laterals with "snipped off" terminals that fruit is as plenty within a few inches or a foot of the soil, as it is in any part of the tree. Under the old method the trees were bare below and about the main forks. Under the new method this zone is filled with small branches loaded with fruit. From among those who have given long pruning a three years trial there are no backsliders, nothing but highly enthusiastic advocates and practitioners The beheading or topping method has gone, to return no more.

ECHOES OF AVOCADO CONVENTION

(Continued from Page 901.)

rectors after they have carefully can vassed the situation as to the amount of fruit available. The fruit should he distributed from this marketing point to local consumers and shipped to distant markets. They could arrange for growers to ship direct to consumers and distant markets, but it should he done under direction of this marketing point."

Maturity Work on Avocados

E. M. Chace, director citrus by-products laboratory, Los Angeles, treated this suhject very fully from both a technical and a practical point of view.

Plant Teague Trees

They Are Grown From Selected Buds Taken From Trees With Individual Performance Records both for Quality and Quantity Production

LEMONS

We can supply Eurekas, Villa Francas, and Lisbons. All budded from the best and most prolific bearing types. If you have lemon land do not be afraid to plant Lemons. They will yield satisfactory returns when they come into bearing.

LIMES

Every home orchard in the protected localities should contain one or more lime trees. We have some extra large trees of both the Mexican and Tahiti Seedless varieties.

POMELOS

We still have a few nice Marsh Seedless, Triumph, Imperial, Foster and Duncan trees unsold.

Handsome returns are realized from Pomelo orchards where properly planted and cared for.

ORANGES

We can still supply a limited quantity of Navels, Valencia Lates, Mediterranean Sweets, Ruby Bloods, St. Michaels, Tangerines and Mandarins for both home and orchard planting.

AVOCADOS

Good thrifty field grown Fuerte and Sharpless trees for immediate delivery.

FEIJOAS

Grafted from the best large fruiting varieties.

Write for our new descriptive price list describing forty-six varieties of Oranges, Lemons, Limes and Pomelos and seventeen varieties of Avocados and other Tropical fruits.

It's free to those interested.

The R. M. Teague Nurseries

Box A **San Dimas, California**

Founded In 1889 by R. M. Teague

Extracts from this paper, of interest to all, are here given:

"Natural and commercial maturity cannot be correlated, for, manifestly, many things are sold and eaten before they are naturally mature. Commercial maturity may be said to he that stage of growth at which the fruit may be harvested with equal satisfaction to the producer and consumer alike. The producer ever seeks to put his product on the market physically sound, while the wise consumer ever seeks fruit that has developed its full size and flavor. There is no definite natural point at which one can say a fruit is commercially mature. Some persons of peculiar tastes will enjoy fruit which is much too acid for the average consumer, and some will not care for it until it is so far advanced as to seem insipid to the great majority. After giving the matter considerable thought for several years I have come to the conclusion that the only reasonable way to handle the question is to set a purely arhitrary standard which should be as low as good marketing practice will permit. This, it is true, will not place before the public a product of which the great majority of growers should feel proud. The standard must be high enough so that the fruit on reaching the market will not turn the majority of the buying public against the crop as a whole. Any standard which will not accomplish that is worse than useless. This, of course, is not satisfactory to the market hog, who would dispose of his crop at the greatest profit to himself alone and let the other growers look out for themselves, nor is it entirely satisfactory to the idealist who would make it much more severe. The former, however, is a public nuisance which should be hated, and the latter has his remedy in his private brands, where he can regulate the quality of his output to his own satisfaction.

"Some fruits undoubtedly develop the best eating quality when left to mature upon the plant, but this is not the case with all fruit. Certain varieties of apples and pears are always harvested before maturity in order to develop their maximum flavor, and in some cases several weeks of storage are necessary. Bananas, for instance, are harvested green in the tropics, even when they are intended for local use, and are said to develop a better flavor thus than when left on the plant to mature. It must be confessed, however, that the depredations of birds and insects upon the maturing fruit have had no little part in bringing about this custom.

"The above mentioned fruits increase their sugar content after removal from the tree, as they have stored within the fruit material from which sugar is produced. Other types of fruits, however, do not materially increase their sugar content after harvesting. In our experimental work with citrus fruits we have failed to find evidence of any increase in sugar content after the fruit is removed from the tree. There is, however, a decided decrease in the acid content, which is sometimes mistaken for an increase in sweetness.

"It is apparent, then, that some fruits may be harvested some little time before they are ready to eat, while others should be left upon the plant as long as possible.

"In the case of the avocado, the flesh contains no starch from which sugar can be produced after harvesting; indeed, sugar plays no appreciable part in the composition of its flesh and in all probability gives no indication of maturity. In fact, so far as the limited data on hand go, they show less sugar hy far in the matured fruit than in the green. Apparently, also, the sugar decreases after the fruit is removed from the tree.

"We must, therefore, turn to other constituents to determine the maturity of the fruit, and naturally the oil content presents the best indication of success. At the present price of avocados, the oil determination method, it is believed, will not become popular, for manifestly the fruit will have to be destroyed for the test, so that we are concentrating on the study of the correlation method.

"With many fruits it is easily possible to predict maturity from the physical characteristics of the fruit. Usually color is thought to be the first evidence of ripening, and often is. But it is also true that some fruits color before they become palatable. Next to color the "feel" of the fruit is most often used; not many fruits can be left on the tree, however, long enough to become soft, as the shipping quality would be lost. The color of the stem is also an indication of maturity. With some fruits the color and condition of the seed or seeds is sometimes used. In the case of Bartlett pears, the color of the seed is taken by many growers as an indiction of ripening, and also the ease with which the stem can be broken from the hranch.

"One naturally looks to the seed as a good indication of maturity, but this examination is not available in the case of the avocado at present, as the fruit is too expensive. Advanced maturity is often indicated by the facility with which fruit separates from the twig, but too often this takes place only after it is too ripe for commercial use. The avocado separates naturally from the fruit spur in two places—at the junction of the fruit with its stem, and at the point where the fruit stem is attached to the parent plant. In our experience many strains of avocados are mature enough to store before they will separate readily at either point. So far, the physical characteristics which seem to us to give the best indication of maturity are the color of the fruit and of the stem."

AVOCADO GROWERS ELECT

The officers for the ensuing year are: President, W. H. Sallmon; vice president, W. L. Hardin; secretary, R. Agnes McNally; treasurer, J. M. Elliott. The new directors are: R. M. Teague, S. M. Jamieson, C. D. Adams. The holdovers are W. H. Sallmon, W. L. Hardin, J. M. Elliott, Mrs. J. T. Stewart, A. F. Yaggy, Dr. Lester Keller. The next convention will be held at Santa Ana, October 9, 1920. The address of the secretary is Altadena.

APPLES TO AUSTRALIA

The United States commercial agent at Melbourne, Australia, cables that the Australian government has removed the prohibition against the importation of American apples, effective May 19, 1920. This prohibition has been in effect since July 18, 1917.

Citrus growers of Tulare County recently met at Exeter and discussed June drop.

MICHELIN

UNIVERSAL CORD

It is fitting that the house which 25 years ago invented the pneumatic automobile tire should now introduce three improvements which result in greatly increased mileage:

1—A new tread compound, perhaps unequalled for durability

2—An improved tread-design that effectively opposes skidding and still further increases the durability of the tire

3—A super-sturdy oversize body that gives unsurpassed freedom from blow-outs

For a new degree of motoring satisfaction, use Michelin Universal Cords.

Michelin Tire Company, Milltown, N.J.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR" Price-list and Samples.

Commissioners Discuss Nematodes

"It is much easier to name the plants which nematodes will not attack than to enumerate the host plants of these pests," according to D. G. Milbraith of Washington, D. C., who addressed the convention of horticultural commissioners being held in Sacramento by the state department of agriculture. Mr. Milbraith is one of the three men in this country who have made a special study of these dangerous soil pests. The nematodes are round worms and are related to the trichina worm found in pork and to the intestinal worms of domestic animals. Some species of nematodes are harmless or even beneficial, but other species are among the most dangerous pests of agricultural crops.

The root knot nematode is not native to the United States but has been introduced in nursery stock and potatoes from the warmer parts of the earth. It is now widely distributed over the tropical, subtropical and warmer temperate countries. Some parts of California are still free from nematodes owing to the efficient work of the quarantine officers of the state.

No practical control measures on a field scale have been devised. In certain sections like the Imperial Valley some benefits can be obtained by summer tillage, which dries out the soil and dessicates the nematodes. Flooding for a period of time also kills the pests, and they are not found in rice sections. Small seed beds in the nursery can be treated with steam to kill the nematodes. Wheat, barley, corn, sorghum, Sudan grasses and other cereals and grasses are not attacked, and these crops may be grown while attempts are being made to clean the land. Alfalfa is not injured by the nematode, but furnishes it with a sufficient food supply to enable it to live over in the soil.

While it does not seem practicable to attempt to exterminate the nematode in orchard sections, it may be possible to localize infestation. It is hoped in time that all infestations may be reported to the horticultural commissioners and that thereby sections of the state not yet infested can be kept clean. It is extremely difficult to detect all infestations of nematodes, owing to the fact that often there is no outward indication that nursery stock is infested, although typically a characteristic knotty condition of the root is observed. The necessity for continued rigid inspection was pointed out, however, for even if inspection cannot be expected to keep out all infested stock, it will repay the cost many times if it postpones the infestation for only a few years.

Although the development of the vacuum fumigation process has taken place only within the last ten years, results which have thus far been obtained indicate that it holds great possibilities for the control of insect pests. The most extensive work has been done with dates in the Coachella Valley, where last year 75 per cent of all the dates were fumigated by this process. Carbon bisulphide is used and the fruit subjected to a vacuum. Experiments with potatoes indicate that the tuber moth, which has threatened to cause a quarantine against potatoes by many states, can be completely killed at a low cost without injuring the potatoes for seed purposes. Storage insects infesting raisins and other dried fruits can likewise be controlled and insects infesting narcissus and other bulbs are readily killed.

A large vacuum fumigator is to be installed in the Port of Los Angeles, several private firms in this state and Oregon are installing apparatus, and indications are that it will play an important part in the future of the cotton industry.

Improvements in the mechanical construction have reduced the cost of vacuum fumigation to a negligible factor when compared with the great losses which would occur if these pests were not controlled.

Making a Pure Seed Law Effective

By G. H. Hecke, Director of Agriculture

Regardless of the expected legislation bearing upon the important question of pure seeds, it is evident that we must view the matter from certain angles which may be affected only indirectly by any future regulations or code of procedure.

The most potent and far reaching factors having direct bearing upon this important issue of clean, high quality seeds are essentially educational, and any good results to be had through the enactment of pertinent laws must of necessity be influenced in a great degree by the care that has been employed in preparing both the consumer and the producer to meet the conditions which will be brought into action by such needed legislation.

California at present has no pure seed law. Such meritorious legislation, however, has been in effect in other states for some time, and notwithstanding the faults and flaws that invariably crop out when new codes and regulations are substituted for the old order, the cumulative benefits to be had under the operation of such laws are readily appreciated and improvement as affecting their efficiency is only a matter of time and progressive educational work.

The great advantages to be enjoyed by a given state from the enactment of pure seed legislation must accrue as well from sources other than those merely having to do with seed inspection and seed testing.

The farmer must of necessity be taught that poor seed is dear at any price.

Under such conditions the dealers, being confronted by more critical buyers who decline to use cheap and inferior seeds, will discontinue or discourage the sale of any but a better grade, produced under favorable conditions and guaranteed as to germination and freedom from excessive admixtures of noxious weed seed.

And seed laws which may be placed on the statute books in a given state have for their primary object the improvement of the quality of agricultural seeds, but to realize the greatest benefits to all concerned we must revert to the source of much of the past difficulty and apply certain remedial measures on the farms where the seeds are produced.

The seed grower should understand that clean seeds reasonably free of weed seeds in the end mean dollars and cents to him and that the reputation of his business will receive the greatest stimulus through the exploitation of a guaranteed product, exceeding in fact the returns from any other known source of advertising.

As an index to the great injury that misrepresentation can work a given seed house, we will cite the following:

A lot of seed was purchased for alsike and timothy mixture. Analysis showed it to contain 28 different kinds of weed seeds, amounting to nearly 12 per cent by weight. This seed was shipped by a Middle Western seed house which was guilty of many other infractions of the laws of common honesty. In the absence of a federal law it may not be possible for the state to hold up interstate shipments such as these, but we may rest assured that but few hard headed, thinking farmers will go back to that seed firm when they want more alsike and timothy.

Thus we may see that the efficacy of any so-called seed laws that may be established depends in a large measure upon the consistent observance of many related factors which may not for purely mechanical reasons be adequately covered by the law as written.

To this end, then, we should have:

A wider common knowledge of weeds and approved methods of control and eradication to be taught in the schools and agitated by the press through newspapers and farm journals.

The earnest cooperation of farmers, seed dealers and seed producers in California, making for the establishment of standardized grades of ap-

International Dehydrator

Has the endorsement of the ENGINEERS of all the Large Fruit Growers Associations of California—Therefore

"It Must Be Right"

The International Dehydrator is equipped to use ANY KIND OF FUEL—ELECTRICITY OR GAS ENGINE POWER can be used—and can be operated WITH or WITHOUT WATER.

Installations can be made anywhere on orders booked at once.

proved strains and varieties grown and stored in California under favorable conditions.

A radical departure from the over-colored, extravagant style of advertising so-called phenomenal varieties to be replaced by a plain, honest, descriptive statement as to variety, merits, etc.

CALIFORNIA AVOCADO CONVENTION

The new board of directors of the California Avocado Assnciation met May 20 at the home of J. M. Elliott. The election of officers was the first business of the meeting. Wm. H. Sallmon of San Diego was reelected president. Mr. Sallmon had announced his intention of retiring from the office but acceded to the urgent request of the board to continue as president for another year.

J. M. Elliott, who had served as vice-president and whom the directors desired to reelect, was, at his request, relieved and was unanimously elected treasurer.

Dr. W. L. Hardin, who has devoted much time, energy and ability to the office of secretary for two years, was elected vice-president. R. Agnes McNally of Altadena was unanimously made secretary and manager of the new bud selection department. With the addition of this new department, which is one of the most important matters yet undertaken by the association, the work of the secretary will be so increased that the members at their recent annual meeting voted to employ some one whose whole time should be devoted to it.

The fall meeting was set for October 9 at Santa Ana.

The annual report covering the October meeting at Santa Barbara and the recent annual meeting at Los Angeles will be published immediately. This report is to include all of the papers and discussions of the two meetings. The membership of the association has grown from 216 to 335 during the past year.

GRAPE EXCHANGE ELECTS OFFICERS

The California Grape Growers Exchange came into existence on May 18 when articles of incorporation were filed with the county clerk of San Francisco and the secretary of state at Sacramento, starting with a membership of 350 growers owning or controlling 20,000 tons.

The officers for the ensuing term are E. M. Sheehan, president and manager; C. E. Humbert and Frank T. Swett, vice-presidents; H. F. Stoll, secretary, and George M. Bowles, treasurer.

The board of directors includes C. E. Humbert, representing Lake, Mendocino and Sonoma Counties; E. A. Flanagan, Napa and Solano Counties; Frank T. Swett, Alameda and Contra Costa Counties; A. E. Haentze, Santa Clara, Santa Cruz and San Benito Counties; Andrew Johnson, Yolo, Sacramento, Placer, El Dorado, Yuba and Sutter Counties; T. H. Kewin, San Joaquin, Stanislaus and Merced Counties; C. E. Crawford and E. M. Sheehan, directors at large, and George M. Bowles, representing the state market director.

E. M. Sheehan, Frank T. Swett and George M. Bowles constitute the executive committee; T. H. Kewin, Albert Haentze and Andrew Johnson will be the auditing committee. The depository for the funds of the exchange will be the American National Bank of San Francisco.

The board of directors will meet and fix the minimum price at which the different varieties of grapes will be sold in the different sections represented by the membership.

AIDING IN BUD SELECTION

The work of the Bud Selection Association is to be facilitated by the cooperation of the federal department of agriculture. We have letter from Prof. A. D. Shamel, who only recently returned from a period of sugar cane investigations in the Hawaiian Islands, in which he says:

"We are planning to concentrate this summer on deciduous and bud selection studies. We expect to begin performance record studies with individual trees much in the same manner as those which have been carried out with the citrus. Much of this work—in the beginning, at any rate—will be done in the central and northern part of the state. We are planning to cooperate actively and energetically with the California Nurserymen's Bud Selection Association, of which L. B. Scott is manager. While difficulties have been and will be encountered in developing this pioneer project, as is the case with all similar projects, I am confident that this work will lead to the propagation of better trees and the improvement of the fruit industries through the growing of the best established varieties for commercial purposes and the production of more uniformly good crops of fruit from the best strains that now exist without doubt in these varieties. It is a forward movement which in one form or another is bound to succeed."

CITRUS INSTITUTE

The directors of the California Citrus Institute announce a meeting of that organization for Thursday and Friday, June 24 and 25, at the Elks Club House, Santa Ana.

A particularly strong program is being arranged dealing especially with the care of mature orange groves and with the labor situation in orange groves and packing houses.

One of the features of the meeting is to be a banquet held in the Elks dining room at 6:30 p. m. on Thursday, June 24. This banquet is to be entirely informal and is open to members and non-members alike. Plates $1 each.

Following the banquet a most interesting lecture will be given by W. S. Jones of Claremont on the general subject of water conservation. Mr. Jones is an engineer of very wide reputation and has done more towards the rational conservation of storm water in Southern California than anyone else. Data which he will present from his studies of water storage possibilities will be of very great interest and importance to all of Southern California. Citrus growers and others interested in irrigation agriculture are urged to take advantage of this splendid opportunity to hear Mr. Jones, as well as to partake of the fellowship of the informal banquet.

So far as possible those who are expecting to attend the banquet are asked to communicate with Orange County Farm Bureau, Santa Ana.

TUNE—"JOHN BROWN'S BODY"

Brother's lost a button from his $14 shirt,
Mother's sewing fasteners on her $40 skirt.
Sister's nice and comfy in her $80 fur,
And father works like 60 for his $30 per.

—Delphi (Ind.) Citizen-Times.

STANDARDIZATION

Strawberries noticeably uniform in quality have appeared in the Los Angeles wholesale and retail markets since the plan of consistent prosecution of offenders was put into effect by the Los Angeles County horticultural department. Fines totaling $1,850 to date have been assessed against strawberry and potato growers who prepared and sold "topped" packages.

Judge Chambers of Los Angeles caused $900 to be contributed to the city treasury when he fined each of 16 berry growers and two potato growers $50 after they had plead guilty to charges brought by A. E. Bottel and M. Shepherd under the deceptive pack provision of the state law.

Arrests have been made in Pomona, Long Beach and Santa Monica for deceptive packs of strawberries, and the township justice has in each case upheld the inspector's judgment and imposed a fine. Judge Underwood of Long Beach assessed a penalty of $25 and a suspended sentence of 25 days against a Japanese grower arrested by horticultural inspectors a second time, and other courts have stated that similar action would be taken by them in case of "repeaters."

San Mateo County producers are objecting to annexation of their county to San Francisco.

The Heart of the Tractor

When you come right down to the nub of the matter, while the general design of a tractor is important, still it is really only secondary. If the heart of the tractor—*the engine*—isn't right, the rest doesn't matter greatly, although every individual feature, of course, has its value and relative importance to the whole.

The heart of the International 8-16 kerosene tractor is a dependable, powerful mechanism that has every feature essential to heavy-duty, low cost operation—dust and dirt protection, valve-in-head construction, removable cylinder liners, throttle governor, kerosene mixer, high tension magneto, power-driven fan to supplement effective cooling system—features that stand for economy of operation and minimum repair upkeep.

But it isn't only the heart of the International 8-16 that is built right; every detail of its design and construction from the quickly adjustable drawbar to the wide-face, large-diameter pulley is made with the same conscientious regard for operating thoroughness—satisfactory service to the purchaser.

Confer with your nearby International full-line dealer if you are interested in a dependable tractor that is just right for general farm work and orchard cultivation—a tractor that will render low-cost service on both belt and drawbar —

Control of Root Form of Woolly Apple Aphis

THE treatment in brief is the application of carbon bisulphide mixed with water at the rate of one-half fluid ounce to four gallons. When the liquid is agitated, the portion of the material not entering into solution forms a mechanical mixture with the water. A margin of safety is thereby secured which insures the success of the treatment. Under no circumstances is it necessary to employ a stronger dosage than the foregoing. Constant agitation of the mixture is absolutely essential.

In applying quantities of liquid for the control of soil inhabiting insects, such as the root form of the woolly apple aphis, it is necessary, in order that the material may be effective, to prepare a basin around the base of the tree for the reception of this liquid in order that it may be spread evenly over the soil surface, and to insure permeation and absorption by the soil.

In preparation for the reception of the carbon bisulphide solution the basin should be made as shallow as possible, to prevent exposure of the roots. If the roots are exposed, the gas in solution is prevented from acting upon the aphids thereon, and the treatment is thereby rendered incomplete. The bottom of the basin should be absolutely level, with the soil heaped up around the edges to confine the liquid to the area undergoing treatment.

In order to simplify the placing of the liquid, strips of galvanized iron 12 feet in length and 5 inches in width, providing for a circular basin 4 feet in diameter may be utilized. After leveling the ground about the base of the tree one of the strips of galvanized iron is placed with the ends overlapping three or four inches and the dirt heaped up around the outer edges. This gives a level basin for the reception of the liquid and confines it to the area to be treated.

The success of this treatment depends on the one essential, that sufficient liquid be used. Experiments carried out for the purpose of obtaining data on this point demonstrated the general efficiency of three-fourths of a gallon of liquid per square foot of soil treated. This is equivalent to about one and two-tenth inches of water.

This quantity of liquid, in the majority of cases in moist soils, and regardless of the soil type, will penetrate to reach the aphids infesting the roots at the lower levels. This condition is due to the diverence in the depth of infestation in the various soil types by the woolly aphis. In general it may be said that the root infestation by this insect occurs at greater depths in light soils—for instance, the shale loams—than is the case in heavy soils, such as the clay loams. On the other hand, a given quantity of liquid will penetrate a given soil in proportion to the depth of the aphis infestation in that soil. For this reason a standard recommendation can be made as to the quantity of liquid required for all soil types.

The treatment may be used in either dry or moist soil, but is less laborious in the latter. If the ground is well drained, the best results are obtained after a heavy rain, when the soil is saturated, since a given quantity of liquid will penetrate deeper in moist soil than in dry soil, thereby resulting in a more thorough control.

When the liquid is applied to dry soil, most of the liquid, (when used at the rate of three-quarters of a gallon per square foot) is taken up and retained by the first few inches of dry top soil. In order to insure the death of the aphids in the lower levels of the soil under these conditions it is necessary to use a much larger amount of liquid per square foot of area treated, with a consequent increase in labor and cost.

FRUIT STOCKS FROM ORIENT QUARANTINED

The secretary of agriculture has issued a quarantine, effective June 1, prohibiting the importation of fruit stocks, cuttings, scions and buds from Asia, Japan, the Philippine Islands and Oceania. This quarantine was issued in response to a hearing held at the department in Washington, March 9, and is for the purpose of excluding from the United States diseases and insects which are known to infest such materials in various oriental countries. These pests include cankers, blister blights and rusts, the Oriental fruit moth, the pear fruit borer, and the apple moth.

This quarantine has very little commercial significance, as the importations involved are limited in quantity and of minor importance. Such imported fruit stocks and cuttings have hitherto come chiefly from France or other European countries, and only recently have some requests for permits for the importation of such stock from Japan been received.

Enough is known of the insects and diseases which attack such trees in the Orient to indicate the extreme undesirability of opening up general commercial importation of such articles. Furthermore, no adequate survey of these countries has been made, and the diseases which are not known probably outnumber those which are known. It will still be possible under Quarantine No. 7, to which this action is an amendment, to import the articles prohibited through the agency of the department of agriculture and under full departmental disinfection and control to meet all legitimate needs for the introduction of any new varieties or strains of necessary stock which would otherwise not be available for horticulturists in this country.

SUGAR SAVING SUGGESTIONS

(Continued from Page 899.)

bottom in a wash boiler or large pot containing enough water to rise to about one-half or two-thirds the height of the jars. Place the lid on the boiler and heat the water to boiling. After the water boils, continue the heating for 20 minutes for most fruits. Pears, apricots and clingstone peaches require 25 to 30 minutes unless very ripe. Remove the jars and tighten the caps while the fruit is still boiling hot. Wax top cans may be used in the same way if the wax is not applied until the cans are taken from the sterilizer after sterilization.

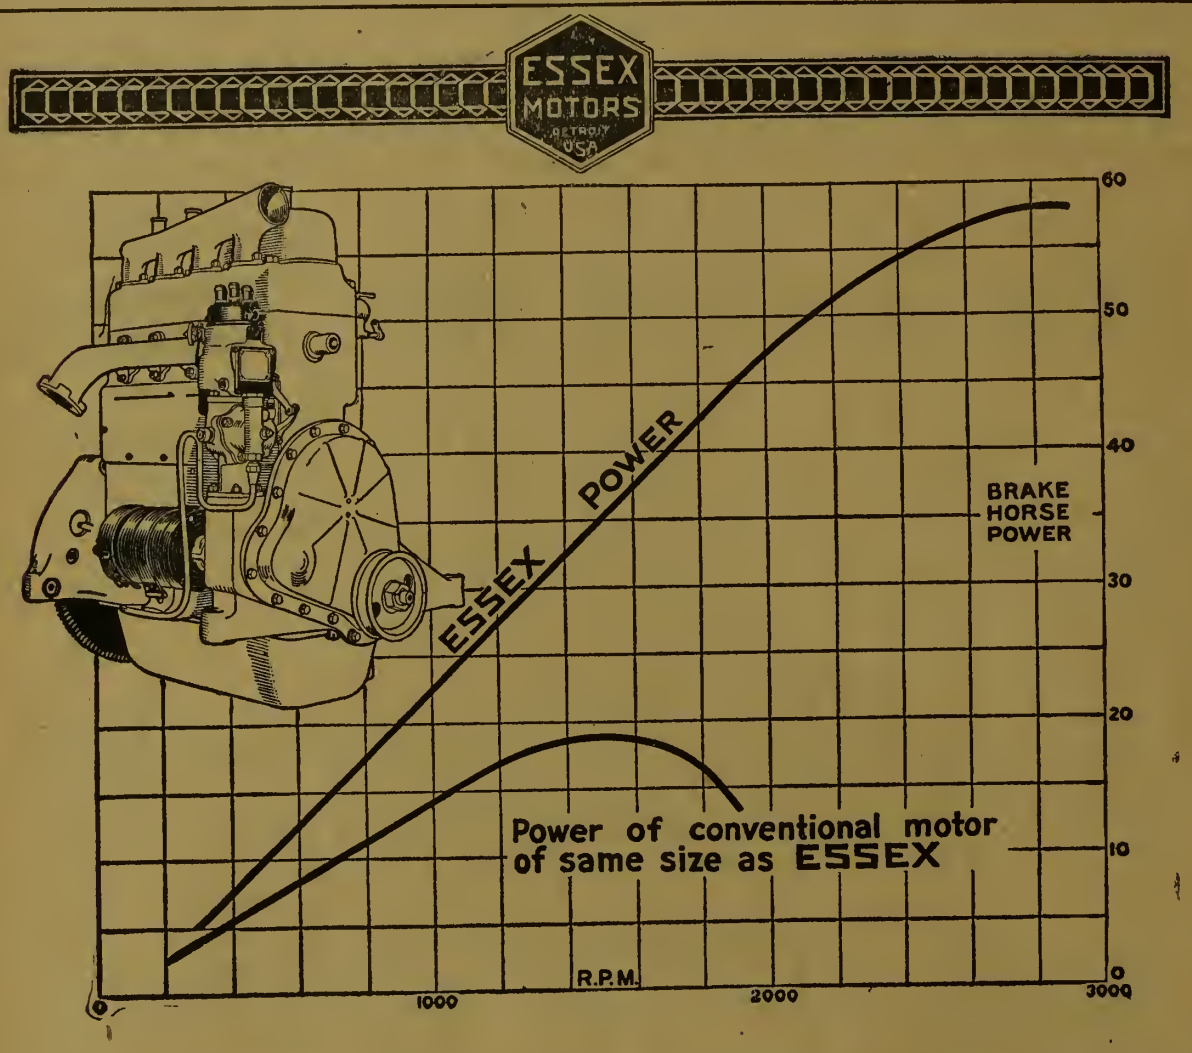
This is what is usually called the hot pack method. The cold pack method described below can also be used, but has certain disadavantages for this purpose, as more water is necessary and the sterilization is less certain.

Canning With Sugar Substitutes

The additional sweetness required in some cases and for some tastes can be obtained by the use of sweet substances other than sugar. Of these obtainable in the market, the principal are corn and other syrups, and honey.

If the hot pack method described above is used, one-fourth to one-half a large cup of syrup should be added to each pound of sweet fruit at the preliminary boiling. For acid fruit about twice this amount may be needed. Where necessary a very small quantity of water to prevent scorching should also be used.

Where syrup is used the cold pack method can be employed. This differs from the hot pack method simply in the omission of the preliminary cooking in an open pot. The prepared fruit is packed directly in the jars or cans and then covered with a liquid made by mixing and heating a cup of syrup with two to three cups of water, according to the sweetness desired. The liquid is added while boiling hot. To avoid breaking glass jars this hot liquid must be poured slowly and carefully into the center so that it does not come in contact with the glass un-



Note How Essex Trebles Motor Power

The swing of interest to light cars, led by champions of the Essex, calls for particular caution.

Some may think of Essex only as one of a finer type, marking a general advance in standards throughout the light car field.

But the facts quickly expose that mistake. The Essex Motor is patented. No larger than standard motors that yield but 18 H. P. at utmost, the Essex delivers 55 H. P. And Essex performance, so enthusiastically admired by all motordom is the product of that exclusive invention.

Essex has set the greatest official endurance record of 3037 miles in 50 hours. It has never been equalled by any car, regardless of size or price. And Essex made the world's 24-hour road record of 1061 miles.

All Results of Its Patented Motor

For cars of its piston displacement it has set every official record from 1 to 50 hours. And in its first year it set a selling record never equalled in motor history.

It creates a new standard of light car capacity in a totally new type. And it cannot be copied. Do not forget that. You can get the abilities for which these records stand, only in the Essex.

Essex Motors, Detroit, Michigan

(199)

til it is partially cooled by the cold fruit.

The sterilization is then carried out in a covered boiler, as already described for the hot pack method.

The only advantage of this method is that most fruits can be made to retain their form a little better. Its disadvantages are that it requires more water, which takes up valuable space in the jars; it is often difficult to expel all the air from the jars and there will, therefore, be an unnecessarily large unfilled space below the cap; it requires more fuel for heating; and, finally, the sterilization is less certain, owing to the difficulty of estimating how long it takes for the inner parts of the fruit to reach the boiling point.

Use of Fruit Juices in Canning

Many fruits contain more juice than is necessary to cover the solid parts of the fruit in canning. This juice which remains over after canning may be used instead of water or syrup in canning other fruits which are deficient in juice.

Grape juice or juices from other fruits may be prepared by crushing the fruit or passing it through a food chopper, heating it to the boiling point and then separating the liquid from the solid part by pressing and straining through a cloth or jelly bag.

The objection to grape juice, and some others for canning is that they are often too acid. The acidity may be diminished by adding two level teaspoons of precipitated chalk to each gallon of juice while boiling hot. After stirring for several minutes the juice is strained through a good jelly bag and is then ready to use as a substitute for syrup in canning. The chalk can be obtained cheaply at a drug store and is perfectly harmless. Instead of chalk, baking soda may be used in the same proportion and without straining. Very ripe grapes in the hotter regions do not usually have an excess of acid.

In making jellies, jams, preserves, etc., an increase of sugar is an essential part of the process and not simply a matter of taste, as in canning.

Jellies and Marmalades

To make jelly, a fruit such as apples or red currants containing sufficient pectin and acid is necessary, together with an amount of sugar about equal to the juice.

The fruit is boiled until tender with a little water or fruit juice, pressed in a coarse bag and then cleared by passing through a jelly bag. If low in acid, a little lemon juice is added and then three-fourths to a whole cup of sugar to each cup of juice. The juice is then boiled. If it boils at 220 degrees Fahrenheit, it is poured immediately into glasses. If it boils at a lower temperature than this, the heating is continued until by evaporation the boiling point rises to this point. Full directions are given in an illustrated leaflet on "Fruit Juices and Jellies," published by this station.

The large amount of sugar needed in jelly making may be saved by substituting two-thirds cup of corn syrup, honey or fruit syrup for each cup of sugar.

The use of the sugar may be deferred by bottling the juice before the addition of sugar and sterilizing in exactly the same way as described under canning. This juice can be mixed with sugar or syrup later and made into jelly when required.

Marmalades are simply jellies containing pieces of fruit. Sugar can be saved in their preparation exactly as with jellies.

Jams, Fruit Butters and Preserves

These products require about the same proportion of sugar as jellies and it can be replaced by corn syrup, fruit syrups or honey in the same way. Two-thirds of a cup of syrup is equivalent to about one cup of sugar.

Candied Fruits

Corn syrup or honey may be substituted entirely for the sugar recommended in candied fruit recipes.

Fruit Drying

Nearly all fruits can be dried and the use of sugar postponed until they are consumed. Sun drying, for warm, dry localities, is described in "Methods for Food Preservation III"; methods of drying for other localities, in Farmers' Bulletin 841, U. S. A. If thoroughly ripe fruits are dried, very little sugar is needed in cooking the dried product.

Sugar Substitutes

Syrups and honey can with advantage be used instead of sugar in cakes, cookies, bread, pies, etc. Dried fruits, especially raisins and prunes, when cooked with rice and cereals, often make sugar unnecessary. Excellent candies can be made without sugar by a skilful use of raisins, dried fruits, and nuts. Suitable recipes are found in current issues of many household magazines.

Lemonade and coffee, oatmeal and other breakfast cereals can be satisfactorily sweetened at the table by means of colorless corn syrup and other syrups of good quality.

It has been found that the use of a little salt makes a much smaller amount of sugar acceptable in jams and other preserves. Dr. Langworthy recommends the use of one-fourth ounce of salt with each six ounces of sugar to each pound of fruit.

Saccharine, which is 500 times as sweet as sugar, gives a sweet taste, but its use is dangerous to health. It is a medicine, not a food.

Granulated Sugar Not Necessary

For the maintenance of bodily health, vigor and efficiency sugar is only one of several carbohydrates utilized by the body. All of our carbohydrate needs will be amply supplied if we eat generously of starchy foods such as rice, potatoes, and corn products, even if we should entirely eliminate all sugary substances from our diet.

Sugar Equivalents

One cup of sugar may be replaced as regards food value by anyone of the following:

One cup of maple syrup, four-fifths cup of Karo, one cup of sorghum syrup, one cup of honey.

The following table gives the composition of some of the more important sugar substitutes.

	Water Per Cent.	Carbohydrates Pct.	Fuel Value Calories Per Lb.
Sugar, gran., cane or beet, C. P.		100.0	1814
Sugar, brown		95.0	1723
Sugar, powd., free starch		100.0	1814
Maple sugar	5.0	93.0	1685
Maple syrup	34.2	64.0	1160
Honey	18.2	81.2	1470
Molasses, cane	25.1	69.3	1300
Corn syrup	19.0	80.5	1468
Sorghum syrup	28.6	63.3	1154
Ref. malt syrup	20.0	75.0	1360

(From Sherman's Food Products.)

Sugarless Candies

These may be made from dried fruits and nuts. The following recipes are typical:

Stuffed dates may be prepared by splitting the fruit lengthwise and filling the centers with chopped nuts. Wrap in oil paper to preserve the texture.

Fruit squares and dipped dried fruits may be made by grinding finely such dried fruits as seeded raisins, dried figs or seeded prunes in a food chopper, adding one-fourth this amount of shredded or ground cocoanut or other nut meats, moistening with fruit juice, shaping into balls or squares and rolling in powdered sugar or dipping in melted chocolate.

Carameis may be made of two cups of sorghum or Karo syrup, one and one-half squares of chocolate, one-half cup of condensed milk or cream, two tablespoons of vinegar. Cook until it will form a hard ball when dropped into water, pour on buttered pan and when cool cut into squares and wrap in waxed paper.

Sugarless Cakes

May be made by substituting refined malt syrup or corn syrup or other syrups in such recipes as the following, given by Professor Mary Robinson of Missouri: One cup of syrup, one cup of sour milk, two and one-third cups of flour, one-fourth cup of melted fat, one and one-fourth teaspoons of soda, one-half teaspoon of salt, one teaspoon of ginger, one-half teaspoon of cinnamon, one-half teaspoon of all-

Build Up Your Soil With
Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.
Maintain a moist surface mulch.
Will prevent June drop.
Require less irrigation than other crops.
Need no irrigation where soil moisture has been conserved.
Build up poor soils with more nitrogen bacteria and humus than any other covercrop.
Afford the best kind of pasture for cattle and hogs.
As a hay have a food value of 43% more than Alfalfa.
Will improve your silage.
There is no better Bee Pasture.
Thirty pounds of seed is sufficient to plant one acre.
Our seed germinated 96%.

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.
Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now.
Write today, stating location of land and number of acres.

spice. In other recipes similar replacements of sugar may be made.

Ice Cream Without Sugar

Easily and satisfactorily made by use of such recipes as the following: One cup of syrup such as maple syrup, malt syrup, corn syrup, etc., or honey; three cups of milk, three egg yolks. Make a custard of egg yolks and milk, add the syrup, and freeze.

Retail prices of various syrups show that corn syrup is the only syrup that furnishes sugar at a price appreciably less per pound than cane or beet sugar. This means that there is very little economy in purchasing many varieties of syrup to replace sugar. Corn syrup sugar is less sweet than cane sugar—if enough of this syrup is used to furnish the same sweetness as given by a given amount of sugar almost twice as much of the corn syrup sugar will be required. Therefore, for mere sweetening purposes corn syrup is more expensive than sugar. For preserving purposes, however, the corn syrup is cheaper. It is stated that malt syrup can be produced as cheaply as corn syrup. It is sweeter and more palatable than corn syrup, but has to date only been produced for bakers' use in this state.

Most table syrups are made from cane or beet sugar and water, a fact which explains why they must sell for a higher price than sugar. Raisins at present sell for 23 cents per 15 ounce carton, a price, when sugar content is considered, greater than that of sugar itself.

Summary

No adult should eat more than four tablespoons of sugar per day. A part of this may be supplied by sugar substitutes such as syrups, honey, dried fruits, etc.

Use cereals or other starchy foods to replace sugar in the diet. These may entirely replace sugar without serious consequences to bodily and mental vigor.

Reduce to a minimum the sugar used in beverages such as tea, coffee, and cocoa. Many beverages are served sweeter than they need be and sugar is often left in the cup.

Cereals such as boiled rice, wheat flakes, rolled oats, etc., if thoroughly cooked and properly salted, are palatable without sugar. If sugar is desired, add dried fruits at time of cooking.

For desserts, use recipes calling for less sugar, substituting corn syrup, malt syrup, or other syrups where possible in such recipes. Serve more fresh fruits for dessert. Omit rich desserts calling for large amounts of sugar.

When sugar is craved, buy fruits. The substitution will be better for the body and will satisfy the need for sweets.

Saccharine is a medicine, not a food. It should not be used except on a doctor's prescription and for patients who cannot assimilate sugar.

Can fruits after they are dead ripe and without sugar.

Put up jelly juices in tin or glass and take a chance on prices of sugar dropping later. Then make up the jelly.

Dry fruits instead of canning in localities permitting this method. Use more dried fruits to replace sugar in the diet.

June in the Vegetable Garden

Southern California

By D. F. Reichard

THERE are reports from the government crop reporting bureau that the indications are that this year's crop will not be sufficient to supply home demands, let alone have a surplus to ship abroad. This is a very serious condition, and the one method to overcome it is to increase as much as possible the yield of the home gardens. The department of agriculture asks all who have the space to put in a garden and produce something for home consumption. This can still be done, especially on ground that has been cleaned or worked up earlier in the season. Land that has had no attention and been allowed to go to weeds, by this time is almost, if not entirely, dried out and will take a lot of water to soak up. Unless water is cheap the expense will be more than the crop would yield. But on a plot that has been under cultivation the moisture will not be used up and with a reasonable amount of irrigation can be put into shape for a dandy summer garden that will produce good, substantial food.

At this season of the year seeds should be put into the ground as soon as possible after the soil is made ready. Set plants as late in the day as practical and be sure to put water at the roots. The cool night air will revive them so that the plants can better stand the drying air of the day.

June is a good month to plant vining plants. Make generous plantings of Pike's Peak or Hubbard squash for winter use, Early White Bush or Fordhook summer squash. Chicago Pickling and Davis Perfect cucumbers planted at this time will be ready to pick during August and September. This is the best month to put in casabas; muskmelons and watermelons planted at this time come in for use on those warm September and October days.

Plant freely of the more substantial food crops—corn and beans. These will be ready for use in from eight to 12 weeks. Plant Oregon Evergreen or Country Gentleman sweet corn, Stringless Green Pod or Kentucky Wonder beans or any variety of field corn or beans that will mature before frost. Put in small plantings of the hardy vegetables for continuous supply. Set plants of peppers, tomatoes and egg plant for late crops.

When the garden needs wetting do so by running the water slowly in furrows beside the row of plants. Cultivate as soon as the soil breaks up nicely without sticking to the tools.

Watch out for garden enemies and plant diseases. At first appearance of either make an immediate attempt to eradicate it. If any plants are backward, work in a small quantity of commercial fertilizer around each plant as a stimulant.

Arizona

By M. E. Bemis

THE garden crops which may be planted in June are even more limited than those in May. The principal work of the gardener for June will be preparation of the land for beans to be planted in July or August or getting the land ready for later crops.

It is true that it is not yet too late to set out tomato or sweet potato plants although the best results cannot be expected from plants which are put out in June. Land that is idle or which would prove troublesome from weeds may be greatly benefited by having grown on it a small crop of cow peas. Casabas and pumpkins may be planted but it is a little late even for these to do their best.

The crop for the garden, which promises most at this season of the year, is corn for roasting ears. Fortunately there are two varieties which do extremely well in southern Arizona. One of these is the old and well known variety of Mexican June. That which is commonly grown here has been improved by selection at the Sacaton experiment station where the long staple cotton was brought to its present stage of perfection. This variety of Mexican June corn does exceptionally well. Unlike most field corn it makes splendid roasting ears. Another variety is the Pima. This in many respects is quite similar to the Golden Bantam sweet corn, although nearly white. This variety, so far as

we know, originated with the Indians and has been improved to some extent by selection. The fact that it has been grown in the arid sections makes it of inestimable value as a sure crop. The ears are small but the plant is prolific. It grows to a height of only three to five feet usually and may be planted in any month of the summer season and roasting ears are frequently obtained in ten to eleven weeks from planting.

Northern California

By A. R. Gould

NEW plots may be sown this month for a successional supply. As the earlier crops mature they should be cleared off, the ground limed and manured and put into good working condition for later crops. Do not let the ground lie idle too long. Make it produce, but keep it well supplied with manure. Bear in mind that every crop you take off removes many of the essential elements from the soil which must be put back. Considerable areas in this state have been cropped year by year and no thought has been given to the manure question. The result is impoverished soil. Certain important soil elements for crop production are carbon, oxygen, hydrogen, nitrogen, sulphur, phosphorus, potash, lime, magnesia and iron. All these are absolutely essential and a deficiency of any of the soil elements acts detrimentally to the growth of the crops. The need of manuring the soil is apparent and where it is not possible to obtain farmyard manure a well balanced concentrated artificial fertilizer must be used. Soil bacteria are working while we sleep and a fertile soil is full of these microscopic organisms whose purpose is to make the chemical elements soluble for the roots of crops. These organisms can only perform their work in a fertile soil or one that contains a proper amount of humus or organic matter such as decayed leaves or farmyard manure. To try to raise crops on impoverished soil or sow seeds is to waste time and money and get no results.

Lettuce

Translant those sown last month in rows six inches apart in the row having the rows well irrigated. Towards the latter end of the month sow Los Angeles and California Cream Butter.

Beans

On well prepared ground sow Golden Wax, Refugee, Canadian Wonder or Stringless Green Pod, all good dwarf varieties. White Tepary is a small white which will grow on sandy soils with little water. As a shell bean it is excellent. Varieties of pole beans to sow now are Kentucky Wonder Wax and Burger's Green Pod. These should be sown in rows two feet apart, and after they are several inches high they should receive frequent cultivation through the rows. If aphis appear on the young shoots, spray with Black Leaf 40.

Tomatoes

These should be now getting fairly well established and will require cultivation around the plants and a little water, but after this month they should not require much more irrigation. If they are to be allowed to ramble along the ground, very little attention will be required, but if the training method is adopted they will require stakes for support and one to three main stems may be run up.

Potatoes

Cultivate between the rows of the early varieties, and the soil should be drawn up toward the plants, thus protecting the tubers. Any plants showing signs of decay or disease should be removed and burned. Burbank may be planted as a late crop on well prepared soil. Secure only clean seed.

Parsnips

This is an excellent vegetable for fall use and may be stored to keep through the winter. Sow the seed in rows 18 inches apart in fairly rich soil. Hollow Crown is the best variety.

Squash, Cucumbers and Melons

Keep these well supplied with water to get them established and cultivate around the plants.

Corn

Continue to sow such varieties as Country Gentleman, Golden Bantam and Golden Cream. Sow in small hills two to three feet apart each way and as the seedlings appear thin to three plants to each hill.

Leeks and Celery

There is still time to plant these out in prepared trenches. Rich soil is very essential. The plants should be set six to nine inches apart to allow for development. See that the soil is in a moist condition before planting out. Best varieties are: Celery, White Plume and Golden Self Blanching; leeks, Dobbies Champion and American Flag.

Beets

Sow for succession in rows 12 to 18 inches apart, later thinning the plants to four inches apart in the row—Improved Blood Turnip and Crosby's Egyptian. They require a rich, moist soil to thrive.

Cauliflower

Make up a small seedbed in a semi-shaded position and sow California Wonder or Early Snowball. In the meantime thoroughly trench your plot with manure 18 inches deep, as the success of this crop depends on soil preparation.

Turnips

Sow Early Snowball and Purple Top Flat Dutch, in rows 12 to 18 inches apart, and later thin to four inches apart in the row.

Onions

It will be necessary to keep the hoe or wheel cultivator busy. Irrigate twice during the month.

Strawberries

This plot will require some irrigation to keep the plants in fruiting condition. If they show signs of being attacked by red spider or mite, spray with liquid sulphur.

CHANGING MARKETING PLAN

The California Walnut Growers Association announce that they have booked orders for over 10,000 tons of walnuts, 1920 crop. They have decided to discontinue offering futures. The plan to be followed this year in outline is:

First, that any contract already made by dealers may be cancelled for the 1920 crop, provided the request for such cancellation may be received prior to June 1. Then about September 1 allotment will be made to various brokers of amount and grade of goods they may offer in this territory. No orders will be taken, however, until opening prices are announced, presumably October 1. So far as can be judged this early the coming crop of walnuts will be somewhat smaller than 1919 but still large. Many of the walnut sections have been blessed with sufficient rainfall, and while the crop may set slightly later than last year, the association through its field department is urging the best of care and the deepest of irrigation to perfect the crop.

The association will guarantee its opening prices against its own decline on all shipments in transit or on accepted orders unshipped up to the date of a possible decline, but in case of an advance, all previously accepted orders will be charged for at the price prevailing when the order was accepted by the association.

POTATO FLOUR

A recent article published by the British board of agriculture deals with the production of potato flour or farina, and the value of this industry to the farming interests in offering a steady market of wider scope than when supplying potato residues which can be used as feeding stuffs. A brief discussion is given of the choice of varieties of potatoes for this industry, of the manufacturing process, and of the type of factory required.

MEXICAN TOMATOES

The state of Sinaloa, on the west coast of Mexico, furnishes the entire supply of tomatoes exported from Mexico. Last year this crop was about 780 carloads, of which more than 500 cars went to the United States. The 1920 crop, now nearly all shipped, is considerably larger.

RAPID DISCING

Speed up your discing work by putting a CLETRAC on the job. This sturdy little tractor, powerful, rapid and tireless, will replace six to eight horses, work twenty-four hours a day if necessary and seven days a week. Used alone or in "fleets," the CLETRAC is the ideal tractor for every size ranch—for every type of work.

The CLETRAC travels lightly over the surface of the ground with a firm, sure tread, without sinking in or packing the soil. It gets the corners also because it can turn short. In the orchard, too, the CLETRAC is at home. Low hung, with no projections, it weaves in and out among the trees without injuring them. Let the CLETRAC shoulder *your* problems. Write today for that interesting booklet, "Selecting Your Tractor"—it's free.

The FRUIT GROWER says=

"for tree planting genuine GIANT is most satisfactory"

The Giant Farm Powders—Eureka Stumping and Giant Stumping—loosen and pulverize the soil instead of packing it and throwing it high in the air.

Western fruit growers have used hundreds of tons of these Giant Powders for blasting beds for trees. They have proved that blasting with genuine Giant Powders provides free drainage, increases moisture-storage capacity and insures vigorous growth and early bearing.

"My trees planted three years ago in beds blasted with Giant Powder are 75 to 100 per cent bigger and better than the trees that I planted in dug holes," writes H. H. Smith, Oregon City.

You will enjoy reading "Better Farming with Giant Farm Powders." It describes all the new and money-saving methods of blasting beds for trees, subsoiling established groves and orchards, clearing land, ditching, etc. Write for it now.

When Writing Advertisers Mention California Cultivator

June in the Ornamental Garden

Southern California

By Ernest Braunton

JUNE is not a planting month. For a succession of flowers some things are held over—dahlias, gladiolus, and cannas. Plants from pots, cans, boxes and balled plants still may be moved, as they may be at almost any time of the year. Carnations, hollyhocks and violets are some of the perennials which may be planted, and quite a list of annuals may be sown or planted. The writer is putting out asters in his own garden.

But if June is not a planting month it is one fraught with much care and many responsibilities. The constantly increasing heat of summer falls heavily on many plants that are now making their heaviest growth. Water must be supplied in heavy quantities. It may be that in August we shall begin to rest roses and a few other plants for an autumn spurt in blooming, but June growth of all sorts must be encouraged and fostered.

There is no month in the year that plants and soils need more protection from heat. Shade, whitewash, mulch, should be added to copious and frequent waterings. The surface soil must be lightly but often stirred. Cultivation conserves much water, aside from killing weeds and aerating the soil. While thorough watering through irrigation must be practiced, light morning sprinklings are cleansing and invigorating and a very light one may be given on hot evenings, to freshen plants taxed by the noonday sun.

But where days are fiercely hot and nights quite cool do not water at night. The contrast in temperature between noon and night already is too great for many plants. Do not make the range greater with a wet soil over night. Let the soil remain dry and warm over night, as the sun left it, and give plants a light spray in early morning so they will be refreshed for the day's trial and the air kept cooler for several hours. On the other hand, where nights are hot, and with special plants, watering at night is desirable. All day the sun pulls moisture from soil and plant. Supplied at nightfall they have all the hours of darkness in which to drink and restore vitality. Keen judgment and considerable knowledge of plant life are the proper basis for June garden practice and no hard and fast rules may be laid down.

Northern California

By A. R. Gould

A HOME place without flowers is like a world without sunshine. No matter how large or small the house is, it should be set in a garden. Many people we meet love flowers, but excuse themselves from having many in their garden for the reason that they have little time, knowledge or luck in raising them. They think it is necessary to be an expert to produce flowers, but such is not the case. The garden columns of the Cultivator provide the knowledge necessary month by month, and with a little hard work, a few seeds and a good water supply a gay garden and healthy pastime will be within reach of any reader. There is still time to prepare and plant a garden and still have flowers this season. You may plant dahlias by tubers or raise them from seed sown at once in pots of sandy soil. Plants of zinnias, asters, marigolds, cosmos, ageratum, lobelia, stocks, snapdragons, verbenas, sunflowers, calliopsis, larkspurs or salpiglossis may be secured from your nurseryman and set out, and many of the above produce fine cut flowers.

Nasturtiums

For a quick showing and one which will repeat itself by self sowing, nasturtiums are hard to beat. They thrive on almost any soil and once established require very little attention. Seeds may be sown of the climbing types for banks or covering fences, and the dwarf types are useful for massed effect in flower beds or borders. The dwarf variegated leaved are also very pretty. Sow the seed broadcast and cover about one-fourth of an inch deep, watering in immediately after sowing.

Pruning Flowering Shrubs

This is often neglected, but it is an important operation, nevertheless. After they have finished flowering the old flowering shoots must be cut back on all subjects. This will encourage the new flowering shoots to develop. Such subjects as Philadelphus, deutzias, lilacs, etc., will need this attention this month. Use sharp pruning shears and cut back to a bud.

Treatment of Newly Planted Trees and Shrubs

See that these have a regular supply of water and cultivate around the trees to conserve moisture. A mulching of farmyard manure to the roots will be of great assistance and hold the moisture for the season.

Water Gardens

Nothing is more inviting during the hot, dry season than a pool of water, and a few aquatics or water loving plants are very interesting to grow. The pool may be of any size; some even use a small tub sunk in the ground. A small cement pool is not difficult to construct. The depth should be from 18 inches to two feet, and in the pool water lilies may be grown. Of course to grow any large variety to have a range of color a large pool would be needed, but for the small pool, eight or ten feet in diameter, the "baby types" are suitable. These will give a range of color—lilac, yellow, white and rose. The plants should be placed in boxes or large flower pots having a mixture of good soil and cow manure, and the water must cover the rim of the box or pot by several inches. Water loving iris (Japanese) and cyperus (an aquatic grass) should be planted by the edge of the pool. Water lilies love the full sunlight, hence it is not advisable to build the pool in a shaded position. Goldfish, if kept in sufficient quantity, will keep the pool free from mosquito larvae which are so troublesome in still water.

Roses

These will need a good mulch of farmyard manure at the roots, but first cultivate and water thoroughly. This will help them through the hot summer. Cut off all dead flowers and seed pods. At the first sign of mildew spray with sulphur solution or dust with flowers of sulphur. The former should also be used as a preventive of rose rust but must be used early in the season, giving the dormant bushes several applications to be effective. For aphis, or green or brown fly, spray with Black Leaf 40. Tie in any new shoots of climbing roses, as these should be making considerable new growth just now.

Begonias

Tuberous types of these should be planted out this month in a shady situation. They thrive in rich leaf soil and need a fair amount of moisture. They may be secured in single and double forms.

Dual Purpose Plants

By Ernest Braunton

THE great world war brought us to a keener realization of the value of economic ornamental plants than anything else could have done. He who had planted a chayote to cover an arbor found himself in possession of excellent summer squashes at a time when all vegetables were at a premium. Likewise the grower of passion flowers, if he had the right species, could make jellies or jams or have fresh fruit of a pleasant sub-acid flavor.

The writer considers it superfluous to offer any argument on the double value of such plants and wishes only to ask the question: If one may have fruit bearing plants of the highest ornamental value, why plant those having only ornamental value? To be sure, gardens need a great variety of flowers and plants for foliage effect. but let us first procure those of economic value as fundamentals and then introduce variety as incidentals, to give brilliant color or striking effect.

For convenience we will consider some of the plants in alphabetical order and call attention to their special merits or uses rather than group them for general use. Aberia caffra is known to us as the Kei apple, from the Cape of Good Hope. It grows a fleshy, globular fruit two inches in diameter that is excellent for conserves, pickles, etc. The tree is somewhat spiny and therefore is good for hedges. Two species of Actinidia are grown for their excellent fruits, though both are climbers of unusual value—broad handsome foliage. All species are grown as ornamentals but A. arguta and A. Chinensis are the edible species; the latter is called Chinese gooseberry and used for the same purposes as the gooseberry proper. Its fruits are sometimes two inches long. In some cases only one sex of flower is on a plant and if one so finds another plant of the opposite sex must be procured.

Akebia quinnata has been called the climbing pomegranate, though the name is not a good one or of good application. It bears an oblong fruit, four or five inches long, filled with a rich, tasty pulp in which are imbedded the numerous seeds. Only in this way does it at all resemble the pomegranate and it is not closely related to that plant. It is a fine ornamental vine thriving best in partial shade. The edible bamboo was full described in a recent Cultivator, is hardy throughout California and should be extensively planted.

Carissa grandiflora, the Natal plum, is the finest hedge plant grown, in appearances at least; one of most handsome foliage. For a large part of the year it bears, sparingly, a crop of brilliant scarlet berries the size and shape of pigeon's eggs. When fresh they are very palatable; cooked, they cannot be told from sweetened cranberry sauce. Has always fruited best under coastal conditions in California but plant thrives in all localities. The cherimoya was recently fully treated in the Cultivator and is a fine, small fruit tree for the warmer sections only.

When a handsome deciduous shade tree is desired one cannot do better than plant a large fruiting European chestnut. As these trees planted singly are often self sterile, that is, will not bear, it is better to plant two trees, even if close together. The citrus family is too well known to our readers to need listing, but among the newer sorts the tangelo and dwarf Chinese lemon are jewels. Willow-leaved mandarins. kumquats and tangerines are highly ornamental and all living in the warmer citrus sections should have a seedless lime, the best of all for lemonade.

Dates: Who does not like to keep a "date?" The writer believes a careful study of the varieties now grown will reveal one or more that could be profitably grown over much of California for a family tree. The dates might or might not be of good commercial value but sufficiently good for home consumption.

The eugenias in several species should be grown in every garden. They are of the highest decorative value and are extensively planted for "only this and nothing more." But more than a half dozen species bear edible fruits, and it is said that a late comer, E. Hookeriana, is the best of all. It also remains free from insect pests while nearly all other species are infested with scale.

Feijoas and other guavas are pretty well known; all are of good ornamental value yet worth still more as fruit bearers. All do best under heavy feeding and considerable pruning. Of the lot the feijoa is the hardier and the budded varieties are excellent. Seedlings are unprofitable. The strawberry guava still is the more popular and its yellow variety (or species lucidum) is also much in demand. The larger guavas are for practically frostless localities only.

When covering an arbor for summer shade only one may well make use of grapevines, for in no other situation will grapes do better. Thornless blackberries will serve the same purpose, and if for evergreen shade we have a new evergreen raspberry from the Himalayas. This novelty still wears its bontanical name of Rubus ellipticus. It bears yellow berries of fine quality, not firm enough for distant shipping but delicious for home use and the plant is a true evergreen, standing considerable frost and growing rampantly.

Jujubes are deciduous shrubs but decidedly ornamental when in full foliage and quite handsome when in fruit. They are hardy throughout California, good bearers of good fruit but do not seem to be for sale anywhere. Loquats are ornamentals for all parts of the state and seldom is a seedling of little value though it perhaps is better to plant the named budded varieties. Macadamia ternifolia is the Australian nut tree, of first class value for either fruit or decorative purposes. It is hardy and drouth resistant. It should be kept well watered for the first few years but fruits best under dry treatment.

In frostless spots one may grow mangoes, but as hardier varieties are introduced we may extend the planting zone of this most excellent tropical fruit. At present the Haden is the best variety to plant. In dry situations the olive makes a fine shade tree with edible crop and the carob is not without value for like situations. Papayas from the tropics will stand but little frost but failures are more due to "wet feet" during winter, a condition from which the papaya quickly suffers. In appearance the plant is palm like, with large luxuriant leaves.

Persimmons are of good ornamental value when in leaf and a tree well loaded with fruit is a glorious sight after the leaves have fallen. There are many good varieties. The pistachio nut tree will also qualify as an ornamental large shrub or small tree, while for a deciduous shrub the pomegranate has few superiors. Last, not least, where a large spreading shade tree is needed during summer a walnut of any kind has few equals.

WHITEWASH MAY PREVENT SUNBURN

It is quite impossible to state which method is best to prevent sunburn of trees. If moisture is supplied evenly throughout the season in quantities and at times to maintain the proper amount of soil moisture, trees will not sunburn. There is danger if too dry or too wet. Shakes, tree protectors, or whitewash may be used with good results to reduce danger of sunburn. A good whitewash may be made as follows: 5 pounds rock lime, ¼ pound sulphur, ⅛ pound salt, ¼ pound glue. Add sulphur to lime while slaking; dissolve salt and glue in hot water and add to lime solution. Add enough water to make thick as paint. This is the formula recommended by Placer County farm bureau.

Fairbanks-Morse
"Z" Farm Engines
FAIRBANKS-MORSE QUALITY
F M
100%
KEROSENE
is distillate's successor. The "Z" Engine is designed to use Kerosene, and operates as well on gasoline. Not a gasoline engine adapted to run on kerosene but a real kerosene engine. Just another reason why the "Z" is preferred by over 250,000 farmers everywhere.
Users praise it for its power—its sturdy, enduring delivery of work-service. They have found it to be well-built, well-designed to do its job better than others, and free from engine troubles that are most common. Bosch Magneto ignition-service, plus Fairbanks-Morse dealer-service keep it so. For farm-power jobs it has no rival.
Prices: 1½ H. P., 75.00—3 H. P., $125.00—6 H. P. $200.00—All F. O. B. Factory.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Killing Stumps

Please give me information regarding killing of eucalyptus stumps in short time, that is, other than by digging them out green.—Subscriber, Pixley.

When the tree is cut, if the brush is piled along by the old stumps and burned, this will then prevent the stumps from suckering and usually kill them, providing one has taken care to clear the earth from the roots a short distance down. Stripping bark from stump down to larger roots is also effective. To remove stumps, dynamite is quick but expensive. Some recommend boring a one and one-half or two inch auger hole in the stump, or if a large one, two or three holes, filling with saltpeter and allowing to remain for a few months or a year when the stumps will burn very satisfactorily. Then there is the charpitting method, that is, when stump is dry dig a deep hole on one side, fill with fuel and fire. Later when briskly burning, cover over, and the stump will smolder for some days. In some cases the charring continues almost to the tips of the roots. Instead of filling with saltpeter, some have had very good success by using kerosene and filling the holes repeatedly as it is absorbed, and later burning. The use of chemicals to prevent sucker growth is not economical.

Little Housefly

Am bothered with pest of flies smaller than common housefly. They seem to remain suspended or in a group circling about on the porch, and if opportunity offers, enter the house. What kind of fly is it and how may it be controlled?

This query was referred to Prof. W. B. Herms of the University of California. He answers: "The fly your subscriber refers to is undoubtedly the lesser housefly, frequently seen hovering in mid-air or flying hither and thither in the middle of the room. Where the common housefly is encountered most abundantly in the kitchen or dining room, particularly on food, the 'little housefly' will be seen as commonly in one room as another, and very seldom actually on the 'spread' table. The writer commonly observes a half dozen or more of these little flies dancing weirdly in the center of the room midway between the floor and the ceiling. Various observers have estimated that this species constitutes from one to 25 per cent of the total population of flies in the house. The eggs of this species are deposited on decaying vegetable matter and excrement, particularly of humans, horses and cows. The larvae emerge in about 24 hours and may be recognized as compressed, spiny organisms about six millimeters long when full grown. The pupal period lasts about seven days under favorable conditions. From the breeding habits, it will be seen that control depends on the proper disposal of vegetable matter and manures. Dry matter will not breed flies, hence spreading or disposal in such manner that drying is rapidly accomplished will give good results."

Termites or White Ants

How can I exterminate white ants in my house that eat the woodwork, books and papers?—Subscriber, Calistoga.

These pests are extremely hard to control. If there is damp timber or timber lying on moist ground where they can get entrance they burrow or practically destroy all woodwork. Follow their work to the burrow and exterminate by liberal use of carbon bisulphide. This should also be used, so far as possible, in places where they are working in the wood. In confined places, destroy by saturating cotton waste or sponge with the carbon bisulphide. Clear away all dirt from woodwork and allow to become dry. Bear in mind that carbon bisulphide is combustible and even explosive and fire must be kept away while it is being used.

Sweeny

I have a colt three and one-half years old that has developed sweeny. Do not know the cause as she has been running on the range except for about four days work at plowing in a three horse team. Will be greatly obliged if you advise treatment for her. Should she be worked at all? Would it be better to keep her on the range or in the barn?—Subscriber, Cabazon.

Answer to the above is given so completely by an article by Dr. Petrie in the Cultivator of January 25, 1919, that we reprint:

Sweeny is the result of strained muscles of the shoulder. It may be caused by a slip forward or back or by a sudden jerk of the shoulder when the hub of a wagon strikes a solid object or a plow strikes a stone. At first the muscles swell, but are usually not noticed. If the muscles were properly treated at that time they would not shrink below normal and would regain their full strength, but when neglected they will shrink away and become very weak. The proper treatment in the first stages would be plenty of hard rubbing with a good liniment. This liniment would be good for such cases. Equal parts of turpentine, spirits of camphor, tincture of capsicum, ammonia, alcohol and olive oil. Shake well and rub in once or twice a day.

A method commonly used to restore shrunken muscles is to run a tape under the skin the whole length of the muscle. Cut a hole in the skin at each end of the muscle and with a long, flat needle draw the tape through and leave it there. Tie a large knot at each end so it will stay. Soak the tape with equal parts of turpentine and castor oil and leave it until the muscle is up to normal size, then remove it and wash out the wound with a good antiseptic. It will soon heal.

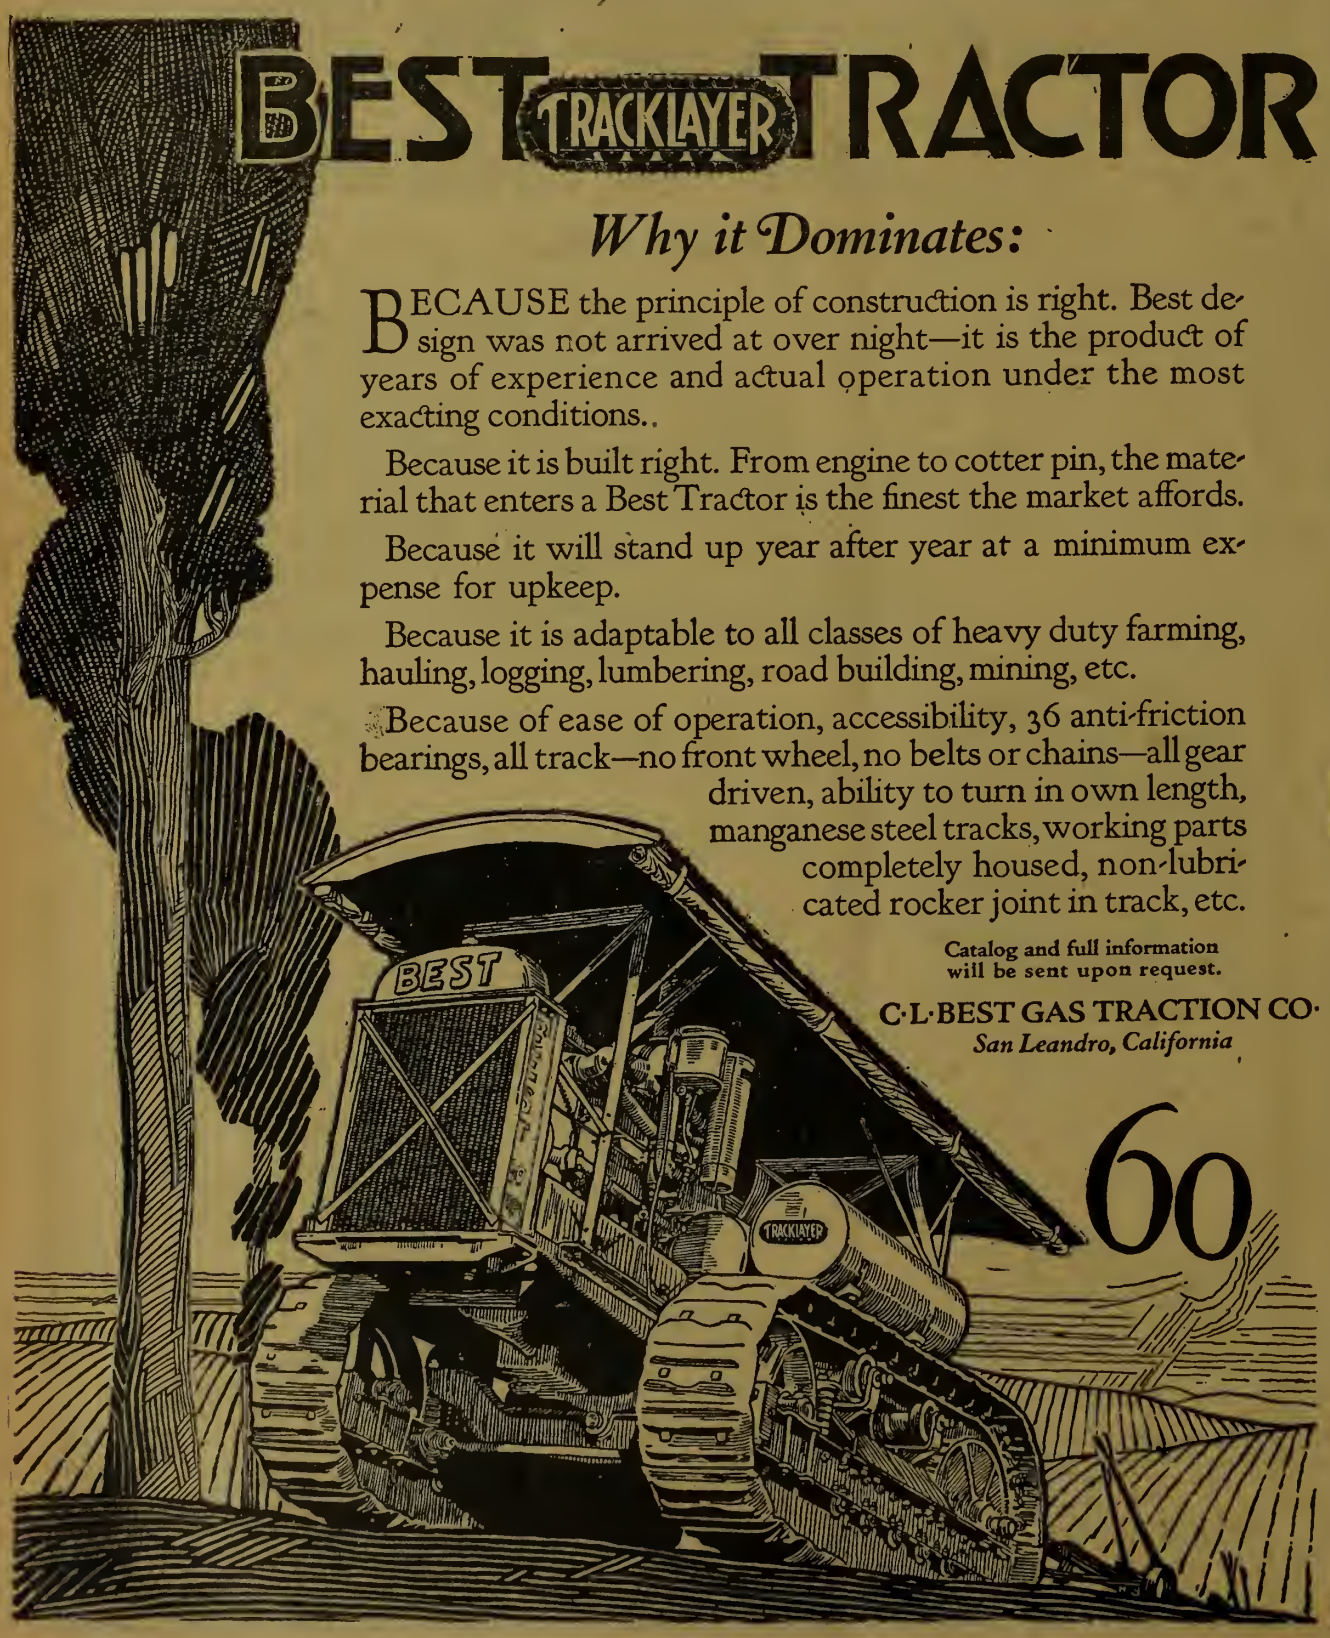
A method I use and recommend is to inject the shrunken muscle with an hypodermic syringe in several places, using equal parts of turpentine and alcohol and using 15 or 20 drops of the mixture in each place. This is a good treatment for sweeny in any stage of the trouble. It is a little severe, but will do no harm. It may have to be repeated in two or three weeks. The patient should be rested most of the time until fully recovered.

The reason for giving the several remedies is because you may not be able to follow one and then you may adopt the other. With the two latter methods you should employ a veterinarian, as you would not have the instruments to do the work properly.

If worked, it should only be with very light draft. Naturally, rest in pasture, with above treatment, would be best.

Alfalfa to Restore Soil

An Imperial Valley subscriber finds that where possible to incorporate more humus or vegetable matter in soils of that valley vastly greater returns may be secured. He asks as to advisability or profitableness of foregoing harvesting of crops for a year and devoting the year to building up the soil; that is, would it be wise to grow alfalfa during the entire sum-



BEST TRACKLAYER TRACTOR
Why it Dominates:
BECAUSE the principle of construction is right. Best design was not arrived at over night—it is the product of years of experience and actual operation under the most exacting conditions..
Because it is built right. From engine to cotter pin, the material that enters a Best Tractor is the finest the market affords.
Because it will stand up year after year at a minimum expense for upkeep.
Because it is adaptable to all classes of heavy duty farming, hauling, logging, lumbering, road building, mining, etc.
Because of ease of operation, accessibility, 36 anti-friction bearings, all track—no front wheel, no belts or chains—all gear driven, ability to turn in own length, manganese steel tracks, working parts completely housed, non-lubricated rocker joint in track, etc.
Catalog and full information will be sent upon request.

mer, plowing under in the fall? If so, would it be best to sow the seed, irrigate, mow the crop as soon as it matures—that is, before the seed ripens—and allow it to lie on the ground, or would it be best to haul it off and return at time of plowing, or would it be still better to allow the crop to stand the entire summer, keeping the land well irrigated, encouraging all the growth possible?

This question was referred to Prof. R. S. Vaile of the university experiment station at Riverside. Prof. Vaile writes:

"It seems to me that the use of alfalfa on the compacted soil would be a very desirable thing. If the alfalfa is cut occasionally it will continue to grow more vigorously than if it is merely allowed to stand throughout the entire season. I believe the root development, particularly, would be better if it is cut at least three or four times during the season. The total tonnage of organic material that would be available for turning under in the fall would probably be greater than were it left standing through the entire season. The growth of the last two or three cuttings for the season would not be as great if the material is left lying on the ground as it would be if raked and hauled off each time, but the total amount to be plowed under would probably be more economically obtained by merely leaving the cut hay lie as it falls."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Estate of Wife

Wife dies intestate, leaving husband and stepson, also brothers and sisters. Her estate is comprised of inherited monies with accumulations, said inheritance being acquired while living with her husband. What distribution will be made?—Subscriber, Los Angeles.

The estate being the separate property of the wife, one-half will go to the surviving husband and the other half in equal shares to her brothers and sisters and the descendants of any deceased brother or sister by right of representation; this distribution being made in the absence of any will. In the case of a will, property is absolutely subject to the disposition of the wife.

Estate of Husband

Husband has acquired estate during 25 years of married life. He dies leaving a wife and one son by a former marriage. What distribution is made of the estate?—Subscriber, Los Angeles.

This estate is community property; one-half goes to the wife and as to the other one-half she is entitled to one-half; the remaining half goes to the son. In such case, half blood inherits equally as whole blood.

Reciprocal Wills

A married couple have property, both real and personal, acquired during marriage. There are two children, one a son of the husband by former marriage and the other the issue of the marriage. It is desired to arrange the property so that upon the death of either, all property should go to the survivor. Will a will made out by each in favor of the other be sufficient? Would it be necessary to have an administrator appointed?—Subscriber, Arroyo Grande.

The suggestion as to the reciprocal wills is an excellent one. It will be necessary in each of those wills to mention the children and state that nothing is left them by reason of the fact that it is known that the survivor of the marriage will adequately care for them. It will also be well to name the survivor as executor or executrix of the estate, as the case may be, to act without bond. It will avoid unnecessary expense and will be the simplest and at the same time the safest manner of handling the case. It will be well, however, in drawing up any such will to go to an attorney in your locality and have it properly drawn.

THE FOLDING BED

Little Boy had returned from a week's visit to his aunt, and was trying to describe the folding bed he had been sleeping in.

"It lays down at night, mamma, and stands on its hind legs in the daytime."—Buffalo Commercial.

The average man marries with the view of settling down, but after the wedding day he is kept perspiring in wild efforts to settle up.

PRINCIPLES ENDORSED BY AGRICULTURAL LEGISLATIVE COMMITTEE

At the meeting held at San Francisco, May 25, the committee made the following statement of its principles:

Agriculture contributes so largely to the prosperity and well being of the public that whatever makes for the legitimate interest of the producer brings a corresponding benefit to the public. Federal and state laws should be enacted permitting bona fide producers of agricultural products to act together, either as corporations or otherwise, in producing, manufacturing, storing, distributing and selling their products.

Whether producers' organizations are formed with or without capital stock, have equal or unequal voting power of members, or pay interest or dividends on the capital employed, are details that should be determined in each instance by the members of the organization with due regard to the nature and extent of the industry itself and the necessities of production, storage, manufacture and distribution.

Any interest or dividends paid on capital, however, should be considered in the nature of a reasonable interest on the capital employed in furnishing the facilities through which the members transact theelr business; such interest or dividends should not be considered as a profit earned by the capital contributed but rather as a fair return to the members for the use of the capital which they contribute to furnish their own business facilities.

The same public concern which authorizes collective organization and action by producers, likewise requires provisions that safeguard the public against abuses by such collective action or producers, and should provide the machinery for such public protection, preserving at all times to the producers the legitimate benefits of their cooperative effort.

It should be understood that the right to organize collectively, under the laws referred to, should be restricted to associations or organizations composed exclusively of producers of agricultural or horticultural products.

SECURITY KANT WOBBLE LADDER

THE SEQUOIAN

A yearling of tbe most approved Poland China type and one tbat bids fair to develop into a remarkable sire. At present I can spare some choice young stock either sex at reasonable prices.

Z. M. Dickey **Dinuba, Cal.**

Lendorris Liberty Bond, Skyrocket and Lendorris Liberator,

Three good sons of three good sires are our herd boars, and are backed by a sow herd of such uniform excellence and approved blood lines as to assure satisfaction to the purchaser of Poland China breeding stock. We have some choice individuals of various ages for sale at all times. Write us for prices.

W. L. Haag and Son **Hanford, Cal.**

Do You Know?

That The Westerner is a half brother to the Junior, Senior and Grand Champion sows at the last National Swine Show.

That his half sister (the Junior Champion) sold for $5000, the record price for an open gilt.

Remember that The Westerner is from a family of "mighty good folks" and that we sell sows bred to him in our Sept. 27th sale.

ALEX. D. McCARTY RIVERINA FARMS MODESTO, CAL.

FORRESTVIEW BOB

A Son of the Grand Champion Caldwell's Big Bob

is the boar that is largely responsible for the number of satisfied customers who have purchased Poland Chinas from me.

Satisfied customers are my specialty. Write me. I will appreciate your inquiry.

J. H. Cook **Paradise, Cal.**

For easy feeding, early maturing Poland Chinas,

Secure the Get of Model Big Fellow

The Reserve Grand Champion of the last state fair, the strongest Poland show ever held in California. His pigs are the kind that satisfy the purchaser. Your correspondence will be appreciated. Write me.

J. F. McSwain **Merced, Cal.**

I AM ALWAYS PREPARED

to offer exceptional bargains in

POLAND CHINA

breeding stock and can fill your order whether it be choice pigs or mature animals. Write for information. I can please you.

Eugene Miner **Lodi, Cal.**

Aviator A strictly big type boar of the most approved ancestry that is siring an excellent class of progeny. We are sure he will help improve Poland China breed in the West. Satisfaction assured on any purchase you make of us.

CROSS BROS. **MERCED, CAL.**

Trewhitt's Big Type Polands

have been developed by a most careful selection of individual excellence and blood lines that have made good in Poland China history. Size and feeding ability have always been essential features demanded. Let your next purchase be a Trewhitt-bred Poland.

W. D. Trewhitt **Hanford, Cal.**

King's Big Bone Leader

Assisted by Giant Bob 2nd, a son of last year's champion, is siring a high grade of Poland Chinas. Remember my big August sale of bred sows featuring the above boars.

Les McCracken **Ripon, Cal.**

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

attained their prominence by their individual excellence, necessary to constructive breeding.

A McCune-bred Poland China is backed up by generations of ancestry that have stood the test. Write for information and prices.

H. D. McCUNE, **Lemoore, Calif.**

1920 State Fair News

THE state fair premium list for the 1920 fair is in the hands of the printer. Secretary Paine expects to have it malled out about June 1. There have been quite a number of changes in the list of premiums and the offering as a whole is the most attractive ever presented to patrons of the California state fair.

In the pavilion classes the board has decided that associatlons of business organizations handling the products of more than one county will not compete with county or smaller subdivisions or otber producers and have offered a series of prizes for the best display of products by cooperative organizations. These cash prizes run from $250 to $50 and will be awarded on the basis of educational value as well as installation and perfection of exhibits. This offer affords lively competition between the fruit handling organizatlons such as the raisin growers, peach growers, prune and apricot growers, almond growers and milk dealers associations. The result should be some very attractive and instructive exhibits truly representative of these industries in California.

In the livestock department several changes have been made. A new class has been inaugurated for cross bred light horses. The animals shown must be by pure bred registered sires out of pure bred registered mares, and wbile not eligible to compete in any recognized pure bred schedules will be shown as representing the types for definite purposes as developed by cross breeding. It is expected that some very interesting experiments by leading breeders will be shown in this class. It will be remembered that Senator Stanford developed some of the greatest trotting horses in the country tbrough mating standard bred stallions with thoroughbred mares. The saddle horse of today is also the work of intelligent cross-breeding carried on during a series of years and there is no reason why similar experiments carried out under modern conditions cannot give equally valuable results, and tbe state board of agriculture in its new offer is showing definite appreciation of the efforts of those seeking to advance the horse breeding game through this means.

Tbe new schedule again places Shetland ponies in the classification of registered pure bred stock. Only those ponies showing registration papers will be eligible to compete in tbe breeding classes. There is also offered a series of prizes for ponies under the saddle and in single or double harness classes. Tbe animals in these competitions are classified by height.

In the horn stock department the board has made a substantial increase in the premiums for Hereford cattle, placing them upon the same plane as the Shorthorns. The premium list calls for $1,500 to the whiteface breeders and the national association agrees to pay an additional one dollar for every two dollars paid by the society, making the aggregate the same as tbe Shorthorn classes. In addition the Polled Hereford association has agreed to duplicate all special prizes won by animals recorded by their association.

The American Jersey Cattle Club, acting on the advice of tbe leading adherents of that breed in California, have increased their special prize offer to $500, placing this state on the same basis as New York, Wisconsin and the largest state fairs in the East. This is a substantial recognition of the efforts made in the past by California Jersey breeders and of the fact that California conditions assist in the development of dairy cattle to the higbest possible degree.

Some slight changes have been made in the sheep schedule. The California Wool Growers Association requested that Corredales be classified with medium wool breeds and also that the Delaines or American Merinos be dropped from the schedule as there are none now maintained in California. This has been done and a classification adopted for Karakules, a flock of these noted desert sheep having been established in the San Joaquin Valley.

The changes in the swine schedule will be very acceptable to representatives of the several breeds as an entirely new class for fat swine, regardless of breed, has been made. The total amount offered is $750 in this class, the largest offering being $300 for tbe best carlot of fat hogs. The carlot has been fixed arbitrarily at 30 head to tbe car. There will also be prizes for pens of single barrows and a grand champion barrow. In this competition the stock will be judged wholly from the butcher's standpoint, and it is expected that tbe very best barrows produced in the several breeds will enter in this competition. The animals shown in this class will not be eligible to show in the breed barrow competition.

Tbe futurities this year are the most attractive ever offered at the state fair. The Poland China Association has received more than sufficient nominations for its junior yearling and pig futurities and the fair management anticipates a wonderful showing of young stock because of this condition. The Duroc-Jersey breeders will have a futurity for fall and spring pigs, $400 in cash being awarded to each class. This offer is made by tbe National Association, in addition to which the American Association has arranged for a promotion club, offering substantial premiums for animals recorded in this association. Tbe Hampshire classification, which was raised last year as a result of a special offer by tbe National Association, has been placed on the same basis as other breeds.

The goat breeders' efforts to increase interest in this industry in the northern section of the state will receive substantial encouragement at this year's state fair. Tbe new classification offers premiums for Saanens, Toggenburgs and Anglo-Nubians in their respective classes. The cash prizes are more liberal than any offered heretofore and will be higber than those offered in any sbow beretofore given. The directors desire to give substantial recognition to the goat breeders and if the latter reciprocate with a good show, this department of the fair will doubtless be featured at future fairs.

Some slight changes have been made in the fruit schedules owing to the high price of fruit; the quantity of exbibits has been cut to five boxes of tbe several varieties named. This will make a suitable showing of the magnitude of the horticultural industries without the use of excessive quantities of fruit which have a high commercial value and which would deteriorate and entail considerable loss to the exhibitors.

DUROC BREEDERS MEET

On Friday night of May 21, the San Fernando Valley Duroc Breeders Association held its regular montbly meeting at the high school building, Van Nuys. President J. C. Craig had the meeting in charge; W. B. Hewitt, secretary. There were about 25 or 30 members present, including a few new ones.

C. R. Thomas, manager of the Los Angeles Livestock Show, addressed the meeting upon special invitation. Mr. Thomas covered the questions of show yard fitting and kindred matters, much to the satisfaction and edification of all present.

C. L. Scbufeldt also had the floor for an offhand exposition of matters pertaining to pig club work and progress in the valley. Mr. Schufeldt is at the head of tbat work in the valley, and among other things is putting on tbe boards a fair and market scbeme that is getting favorable attention over a wide scope of county tributary to Owensmouth as the proposed seat of such venture.

Tbe meeting was voted a big success, and special effort will be made to feature a few live topics for tbe June meeting.

Activities of the membership campaign of the California Cattlemen's Association will be shortly transferred from Inyo County, where results have been very satisfactory, into Zone 2. It is proposed to conduct a vigorous campaign for membership in all the counties of Zone 2, which includes the counties of northern central California. Itineraries of meetings are being arranged and will be announced as soon as they are approved by the officers of tbe various county branches.

The Pasadena Goat Show

By Jean A. Koethen

FIVE years ago a goat was a rare sight in Southern California in most of our suburban towns; now the vacant lots in every village are dotted with them and they browse by boulevard and railway track. It is said the 10,000 milk does reported last year in Southern California south of Santa Barbara have increased to 15,000 today. That is the number actually being milked and does not include bucks or kids or growing stock.

Such an increase is not to be wondered at when we consider that a goat staked on a vacant lot can be fed at a cost of three cents a day outside of what it gets on the lot and that a goat kept on a city lot where there is absolutely no chance for grazing costs but eight cents a day. The average cost of feeding a milk goat is said to be five cents a day. These figures were given me by a man who ought to know, and I have no doubt they are substantially correct.

It was a pity the whole 15,000 could not have attended the annual show of the California Milch Goat Association at Pasadena on May 22. Some of them were there, and there were a good many of the bucks and kids not included in the milk goat figures. Not a few of the milk does were too busy to come, and some, let us admit, were not stylish enough to be invited. For the 300 entrants at this show were the "cream" of the goat population of Southern California. They came from Pasadena and La Crescenta, from Azusa and Eagle Rock and Highland Park, from Lamanda Park and Huntington Park and Redlands. There were a few Los Angeles city goats, but for the most part the goat people stick to the hills. That is where goats belong, anyway.

Toggenburgs, Nubians and Saanens were the three breeds represented at Pasadena, and I am told the order in which I have given them is the order of their numerical importance. The Toggenburg may or may not give more milk or better milk than the others, but the very name is one to conjure with. I did not dare ask the price of many of them, but I was told that a certain Pasadena breeder could furnish absolutely pure bred doe kids at $10 apiece. "Isn't that too high a price to be maintained very long?" I asked the man who told me that. "Oh, no," he replied; "why, they're coming here from Oregon and Washington and all over the Northwest and buying up our goats. The price of grade does may go down but there will be a big demand for pure bred Toggenburgs for years to come." This man, I might add, was willing to sell me a fifteen-sixteenths Tog doe kid for $100.

Another breeder was offering two beautiful three-quarters Tog does about four months old, or maybe a little more, for $75 apiece, and would consider no offer except for the two together. Their names, I might add, were "Annie Laurie" and "Annie Rooney," and they looked the part.

Cunning Kids

One woman breeder (they are largely women, the goat breeders) had eight or ten glossy dark brown flop-eared Nubian kids all ranged about one crescent shaped trough eating alfalfa hay, and no other woman could pass that trough without stopping to look and pat and exclaim. They looked like little dogs, only prettier. And when the blue and red and green ribbons were tied to their collars, how the shiny brown of their big ears did gleam!

In one stall a little girl of ten cuddled a baby Nubian that was too scared to be left alone. In another a man shamefacedly held another, carefully explaining that it belonged to his cousin, and he had just come along to help her look after her charges. That is the best thing about goats—they think they're folks. They belong from the very first. It is no wonder, when we remember they lived with Abraham and Lot 6,000 years ago. They have all the other domestic animals backed off the map when it comes to length of domestication. In nearly every stall was some member of the family comforting and sustaining the timid does and kids.

Nubians and Saanens made a good showing, but Toggenburgs were the big majority. There were some splendid bucks, and not a few does of all three breeds showed immense udders, proof positive of their high production. Many of those exhibited were four quart does and some were six quart.

Goat Milk Products

Bottled goat's milk and frozen goat's milk were served at the milk products counter, and the latter, while it was not as rich as the conventional ice cream, was delicious. Any family owning a goat and an ice cream freezer could serve such a dessert as this every day in hot weather at an almost nominal expense.

The Kids and Goats at Pasadena Goat Show

A bunch of Toggenburgs which are proud of themselves. The picture at the right shows a bunch of prize winning Nubian kids.

Use Pure Salt on Hides

Hides should be salted only with clean, pure salt free from alum, according to a recent statement of the bureau of chemistry, United States department of agriculture. This bureau is making a study of the best methods for skinning farm animals and curing hides in order to produce a high grade leather. Salt containing alum partly tans the hide and sets the hair so that it cannot be removed. Hides which cannot be unhaired properly bring a loss to the tanner and prejudice him in future purchases against hides from the same source.

Tanners recently submitted to the bureau of chemistry green salted hides which could not be unhaired after liming in the usual way, in order to find out the cause. An examination showed that on the basis of the dry hide unhaired spots contained .8 per cent of alumina and the portions where the hair was not loosened contained 1.25 per cent of alumina. The portions of the hide which contained .8 per cent alumina unhaired with difficulty, while the portions containing 1.25 per cent could not be unhaired even on the beam. An inferior salt containing alum had been used

TESTIMONIALS

"Cows increased in one week 3 per cent in milk."
A. L. McCULLOCH, Alpaugh, Cal.

"I never saw hogs do so well or grow so fast as on this molasses ration." C. H. HARTWIG, Yuba City, Cal.

"It has enabled me to keep my stock in better condition at less expense." J. M. HENDERSON, JR., Sacramento, Cal.

"Have one calf that refuses to drink new milk—prefers skimmilk with molasses. What do you know about that?"
R. HECKLEY, Santa Rosa, Cal.

"It has been a great advantage in getting the stock to clean up the roughage." H. H. AMES, Chowchilla, Cal.

"One cow will turn down the choicest handfuls of alfalfa hay unless it has been 'Molassed'."
REDWOOD AYRSHIRE FARM, La Honda, Cal.

MOLASSES

cheaper than hay, but has same feeding value as corn or barley.

Facts in BLACK & WHITE

Purebred Holstein Cattle For Profit

"Both milk and fat are produced at lowest rate in general by the cows consuming the MOST FOOD." This conclusion reached by Prof. H. H. Wing, Professor of dairy husbandry at Cornell, after a year's observation of the herd at the University experiment station. Holsteins are large and healthy, capable of converting large quantities of coarse feed into the best of milk suitable for all purposes, particularly in demand for infant feeding and for cheese making.

If you are keeping cows for profit, investigate Holsteins.

For 30 years I have been devoting my entire time to pure bred beef cattle. I know where and how to buy. I make regular trips to the great producing centers and will buy on order. Best of references. Satisfaction assured. Correspondence invited. R. M. DUNLAP, Hotel Land. Sacramento, Cal.

in salting the hides and had set the hair.

This incident illustrates the importance of attention to details in the handling and curing of hides and skins. Farmers, country butchers and dealers are advised by the department to use only clean, pure salt in salting hides. The presence of alum in salt is especially objectionable and as little as 5 per cent in the salt can be detected usually by its astringent, bitter taste.

Farmers' Bulletin 1055, which gives detailed directions for skinning, curing and marketing country hides and skins, may be obtained upon application to the United States Department of Agriculture, Washington, D. C.

Caledonia Shorthorns to New Buyers

The first public sale of Shorthorns from the Caledonia herd was held at West Sacramento, May 27, and furnished an opportunity for many beginners to secure foundation material for new herds at most conservative prices. It is doubtful if any sale ever held in this state has resulted in more real promotion for the breed than can be credited to the event mentioned. It has been known for some time that there existed in California a growing demand for Shorthorn females, but that few herds were in a position to go far towards meeting the demand. In view of the fact that the Caledonia herd is one of the largest herds in America, it was assumed that Caledonia Farms was the logical source to which these new men might turn.

In selecting the cattle for sale the owners had three objects in mind. It was necessary to reduce the herd somewhat and to afford a chance for California cattlemen to become better acquainted with the Caledonia herd and to enable beginners to secure foundation material. The fact that the entire offering was made up of females, many of which sold with calves at foot or heavy to the service of the well known herd bulls, Imp. Caledonia, Gainford Matchless and Pine Grove King was an attraction that served to bring out a representative crowd of buyers from California and Oregon.

Sixty-five lots were sold for an average of $421, a conservative, though satisfactory price in view of the feed situation in the Sacramento Valley. The strength of the Shorthorn demand in this state was further indicated by the fact that the sale was made without the active support of the breeding fraternity as a whole—the old breeders apparently being content to allow the new men an open field. The entire offering was absorbed by 20 buyers, 18 of whom can be rated as new breeders. Such a number of new herds cannot fail to mean much to the future of the breed. W. A. Heater of Sublimity, Oregon, made his initial purchases which consisted of a number of the better bred things. Heater secured one of the tops in Signets Memory 7th, a daughter of Roan Signet with a cracking good heifer calf by Pine Grove King and heavy to the service of Imp. Caledonia.

C. Harold Hopkins, of Woodland, whose recent purchases of Shorthorns have been notable, got the other top when he paid $1,000 for the Glennbrooks Memory 39th, an outstanding daughter of Glennbrooks Marquis, the bull that made such a record in that herd of cows.

William Bond of Newark selected two of the best Scotch lots, Whitehall Memory 5th, at $725, and Lavenderess 5th at $550. Both carry the service of Caledonia.

Geo. E. Dierssen of Sacramento, continued to add to his new herd, and many of the real bargains of the sale fell to his bid or to that of his sister, Miss Evelyn Dierssen, who made her first purchases. Miss Dierssen got a real bargain in Glennbrook's Memory 32d, with a slashing good bull calf at foot, and safe to the service of Gainford Matchless.

H. C. Muddux and Son, Sacramento, who made a start a few months ago were among the heavy buyers, getting nine lots, most of them with calves at foot.

The Jack London Ranch, Glenn Ellen, added seven of the good ones to their already good herd. Shorthorn interests are delighted to note that the manager, Mrs. Shepard, is going ahead with the work started by her author-brother.

Another new breeder from the Sacramento district to be among the larger buyers was Geo. J. Meister, who has been gradually and conservatively assembling a herd during the past year. Meister got seven head.

Other buyers include the Eder-Johnston Co., Hood; Thos. Harrison, Santa Rosa; J. J. Sumerfield, Santa Rosa; R. T. McGurk, Stockton; R. P. Cornell, Galt; Paul R. Sims, Elk Grove; Weber Bros., Davis; Geo. M. Haight, Montague; L. E. Middleton, Wheatland; W. K. Ford, Ukiah and J. M. Maxwell of Dixon.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Co., Sacramento, Col. Ben A. Rhoades was the auctioneer and John A. Davis of Manteca worked the ring.

Following is a complete list of the sales:

1. Princess Archeress 2d, Nov., 1914; C. Harold Hopkins, Woodland, $650.
2. Pine Grove Belle, April, 1918; W. A. Heater, Sublimity, Oregon, $450.
3. Signets Memory 7th, Jan., 1915, and C. C. Nov., 1919; W. A. Heater, $1,000.
4. Whitehall Memory 5th, March, 1915, and B. C. May, 1920; Wm. Bond, Newark, $725.
5. Hollister Blossom, Feb., 1918; H. C. Muddux & Son, Sacramento, $200.
6. Champion's Queen, Jan., 1917, and C. C. Sept., 1919; W. A. Heater, $550.

STATE FAIR JUDGES ANNOUNCED

Secretary Chas. W. Paine has announced that the following men have been selected to act as judges at the 1920 California State Fair; Dr. C. M. McCampbell, head of the animal husbandry division, Kansas state agricultural college, beef cattle and heavy horses. Dr. McCampbell has officiated in like capacity at many of the larger eastern shows. L. A. Weaver, University of Missouri, will be one of the swine judges. Professor Weaver judged swine at the 1918 California state fair, and is recognized as one of the leading swine authorities of this country. Wilson Rowe of Iowa, will also judge swine, Berkshires, Chesters and Hampshires. John L. Smith of Spokane, one of the leading western Holstein men, will place the dairy classes. W. D. Lee, Mexico, Missouri, nationally known in the light horse world, will judge the light horses and the night horse shows.

Secretary Paine feels that he has secured as strong a list of judges as have ever worked at Sacramento and that this year's show promises to furnish plenty of work for them.

TULARE FAIR DATES ANNOUNCED

Word has just been received by the management of the Tulare County Livestock and Agricultural Show management, from Chas. W. Paine, secretary of the Western Fair Association, that the dates given this county for its fair follow immediately the state fair at Sacramento and precede the Fresno district fair by two weeks. The dates awarded Tulare are September 14, 15, 16, 17 and 18.

By becoming a member of the Western Fair Association and following directly after the state fair, the Tulare Livestock and Agricultural Show is assured of having in its exhibits the finest livestock in the state, as well as many agricultural displays that might not otherwise be available.

Farmers and breeders in the vicinity of Tulare have expressed themselves as pleased with the dates secured, not alone because of the benefit to be received from being in such close conjunction with the state fair, but because the climatic conditions of that time of the year are nearly perfect. They state that it will not be too warm nor will the nights be too cold. Furthermore, the harvest season will be at its height, making possible a wonderful agricultural show.

Among the stock exhibits already entered for the show will be the famous Tulare Holstein herds, whose fame have extended to all parts of the country. The herd sire of one of these herds last week brought the highest price ever realized for a Holstein bull in California, when it sold at a sale for $12,000.

COW TESTING INCREASES PROFITS

Cow testing lessens the cost and increases the profit by cooperative buying and selling of feeds, livestock, and their products. It stimulates farmers to be better dairymen and develop community spirit. By paying cash and purchasing feeds in carload lots members have been able to reduce their feed bills materially. The member who cooperates in the purchase of feed stuffs or in buying or selling cattle frequently may save the greater part of his share of the expense of conducting the assocaition work for the year.

BETTER THAN 36 POUNDS

R. F. Guerin of Sunnyside Herd, Visalia, writes regarding production of some of his pure bred Holsteins as follows:

"Last month K. P. Tola made 36.16 pounds for seven days and is still on test. I intend sending her to Burr Farm, Los Angeles, to complete her yearly record. Also have two heifers, S. V. K. P. Aaggie of Sunnyside, senior two year old that made 21.64 pounds in seven days, and 83.43 pounds in 30 days, S. V. K. P. Fidessa of Sunnyside, 21.85 pounds in seven days, 86.32 pounds in 30 days, also a senior two year old, that are now at Burr Farm to be tested for the year and to be bred to the $12,000 bull King Korndyke Pontiac 20th. I tested eight two year old heifers, daughters of Sir Veeman Korndyke Pontiac, now owned by Burr Farm, Los Angeles. This great sire, a son of Sir Veeman Hengerveld, has 14 A. R. O. daughters, all two year olds, and six have records of over 20 pounds butter in seven days, all made at Sunnyside Ranch. Other records are: Allenvail Clothilde Walker, seven days, 30.63 pounds, a six year old cow; Helena of Sunnyside, a junior three year old, 25.44 pounds; S. V. K. P. Miami of Sunnyside, junior two year old, 17.08 pounds; S. V. K. P. Lenita of Sunnyside, junior two year old, 15.50 pounds; S. V. K. P. Ada of Sunnyside, junior two year old, 14.05 pounds; S. V. K. P. Clarice of Sunnyside, junior two year old, 16.10 pounds; So Long Letty of Sunnyside, junior two year old, 15.26 pounds. K. P. Tola is by King of the Pontiacs.

K. P. Tola

Dispersal of a Beautiful Herd
70—Young Registered Holsteins—70

EDGEMONT FARM OWNED BY C. W. ANDERSON BURBANK, CAL.

Thursday, June 17, 1920, at 10 A.M.

Beryl Mortum Luecke De Kol
A 26.51 lb. three year old daughter of Beryl Luecke De Kol.

Mabel De Kol Niko 2nd
A 24.52 lb. four year old daughter of Roderick Lincoln out of a 30 lb. daughter of Piebe Paul.

This is widely rated as one of the choicest herds in California, and this rating is based upon an unusual combination of good breeding, good size, extraordinary average type, and a rare history of good health.

YOUNG FRESH COWS—HEAVY SPRINGERS—BRED AND OPEN HEIFERS

17 DAUGHTERS OF BERYL LUECKE DE KOL, a young proven sire with 19 A. R. O. daughters, the oldest one a 3 year old with over 26 lbs. butter in 7 days, and she is in this sale.

12 DAUGHTERS OF RODERICK LINCOLN, who has 37 A. R. O. daughters with records up to over 33 pounds butter in 7 days. The largest list of tested daughters credited to any bull yet developed on the Pacific Coast. His dam made 946.25 lbs. butter from 21628.4 lbs. milk in one year.

7 DAUGHTERS OF ABYLA WITKOP, a high class group of extraordinary type and splendid production.

13 DAUGHTERS OF DUKE BANOSTINE BUTTER BOY, his sire a son of Friend Hengerveld De Kol Butter Boy and a daughter of Pontiac Aaggie Korndyke, and out of a dam that made 623.05 lbs. butter from 15427.7 lbs. milk in 305 days.

A DAUGHTER OF KING SEGIS PONTIAC JANNEK, out of a half sister to the 34 lb. cow Jessie Fobes Bessie Homestead that made 932 lbs. butter in one year and sold for $4600 in the Detroit National Sale.

A DAUGHTER OF JULIANA KING REPEATER out of a daughter of a 3 year old that made 678.16 lbs. butter in one year.

A DAUGHTER OF KING SEGIS PONTIAC, bred to a grandson of Tilly Alcartra.

A GRANDDAUGHTER OF KING KORNDYKE SADIE VALE, out of an 18 lb. 2 year old granddaughter of Sir Fayne Concordia.

A DAUGHTER OF MERCI LAD KORNDYKE BURKE, son of the first cow to make 1200 lbs. butter in one year in California, out of a 24 lb. 4 year old whose sire is out of a three-quarter sister to the first 41 lb. cow, Valdessa Scott 2nd, second dam with 731 lbs. butter in one year, third dam with 716 lbs. butter in one eyar.

A DAUGHTER OF PRINCE GELSCHE WALKER, out of a 26 lb. daughter of De Kol Hengerveld Burke, second dam a 26 lb. 4 year old daughter of Johanna Rue 3d's Lad.

TWO DAUGHTERS OF RODERICK ARALIA DE KOL PONTIAC MEAD, who is by a son of De Kol of Valley Mead 2nd and out of a 33 lb. daughter of Roderick Lincoln.

A DAUGHTER OF ARALIA DE KOL PONTIAC MEAD, whose sire is a son of the former world's record cow Aralla De Kol, and whose dam is De Kol of Valley Mead 2nd, 1011 lbs. butter in one year as a 4 year old, she the dam of the 1113 lb. 3 year old Miss Valley Mead De Kol Walker, whose son King Korndyke Pontiac 20th sold for $12,000 in the W. J. Higdon sale.

DAUGHTERS OF HIGH RECORD DAMS, ranging up to over 30 lbs. butter in 7 days.

King Morco Alcartra 5th

The herd sire, King Morco Alcartra 5th, will be sold. He is by King Morco Alcartra, son of Tilly Alcartra, the world's greatest dairy cow, and is out of a 21 lb. daughter of Prince Gelsche Walker and De Kol of Valley Mead 3d, who made 845.11 lbs. butter in one year, and she is a full sister to De Kol of Valley Mead 2nd, 1011 lbs. butter in one year as a 4 year old, she in turn dam of Miss Valley Mead De Kol Walker, 1113 lbs. butter in 348 days as a junior 3 year old, and she is the dam of the $12,000 bull King Korndyke Pontiac 20th. Practically all of the females of breeding age in the sale are in calf to this sire, which should add much to their attractiveness and value.

K S P J COUNT, a son of Mr. James J. Jeffries' famous herd sire, King Segis Pontiac Jannek and the 29.48 lb. cow Agnes Canary Segis, will be sold. He is just ready for light service and should go to a good herd.

REMEMBER that every animal sold is positively guaranteed to be a breeder; that every animal over six months of age has been tuberculin tested by the subcutaneous method by Dr. Hurt, County Veterinarian of Los Angeles County, and is sold subject to retest by the buyer.

EDGEMONT FARM is for sale. If interested in one of the most productive, most profitable farms in Southern California, address the owner, C. W. ANDERSON, Burbank, Calif.

Harvest 20 to 45 Bushel to Acre Wheat in WESTERN CANADA

Think what that means to you in good hard dollars with the great demand for wheat at high prices. Many farmers in Western Canada have paid for their land from a single crop. The same success may still be yours, for you can buy on easy terms,

Farm Land at $15 to $30 an Acre

located near thriving towns, good markets, railways—land of a kind which grows **20 to 45 bushels of wheat to the acre.** Good grazing lands at low prices convenient to your grain farm enable you to reap the **profits from stock raising and dairying.**

Learn the Facts About Western Canada

—low taxation (none on improvements), healthful climate, good schools, churches, pleasant social relationships, a prosperous and industrious people.

OUR COLLEGE OF AGRICULTURE

(Continued from Page 899.)

If the present plan of organization is the best possible solution, well and good. But if in order to give California boys as efficient training in agriculture as is possible in other states it appears necessary to make a change, then by all means let us consider proper and orderly ways and means for bringing about a more satisfactory organization. California agriculture is entitled to nothing short of the best agricultural college in the United States.

We know that there is a sentiment throughout the state that the college of agriculture is not rendering as practical service as is being rendered by other leading institutions. The writer is more familiar with the sentiment of the livestock interests than other branches of agriculture, and he therefore writes rather from that viewpoint. He also knows that the livestock interests have no criticism to make of any individual connected with the division of animal industry. For the most part it is appreciated that the faculty, like the Arizona fiddler, have been doing their "darndest" under the handicaps the system forces upon them.

In order to give a clearer idea of what these handicaps are, it might be well to direct attention to the difference in the working plan of the college of agriculture of University of California and the leading Middle West institutions. A student in any one of a dozen leading Eastern schools who enters upon a four year course in agriculture comes in contact with the "farm" in his freshman year and an effort is made to work into the course of study a proper balance between the recognized fundamental sciences and a direct application of those sciences to the more practical features of his training. For example, Cornbelt boys come in contact with livestock, field crops, orchards, farm mechanics, etc., from the time they enter until they graduate. There is perforce a distinct atmosphere and spirit about such institutions that is not noticeable around an institution organized as is the California college of agriculture. In this state the situation amounts to this: Boys enter the college of agriculture—and many are boys from towns and cities—they have no opportunity to catch the same inspiration as their Cornbelt cousins. For two years and a half they get their instruction in class rooms from lectures and text books, seldom having an opportunity to gain contact with fields, trees, crops and livestock. The last half of the third year they come to Davis for a few weeks. There they get their first contact with the practical side of agriculture. They again come to Davis the last half of their final year. The writer maintains, and the facts will bear him out, that it is absolutely impossible to turn out a graduate under such conditions with the expectation that he is as well trained as a boy who has had four years of training on the farm. In this connection we are reminded of an editorial that appeared in the May number of the Journal of Agriculture, the paper managed and edited by the students in the college of agriculture. The editorial, appearing under the heading, "Can the Curriculum Be Improved," apparently written as a reply to an article suggesting that there might be room for improving the courses, follows in part:

"What is the purpose of the College of Agriculture? Does it attempt to train men for manual labor on the farm, or to manage farms, or to advise farmers, or merely to discuss farm problems in a learned way? The answer seems to be none of these alone, but rather the following: first, to give its students a broad general knowledge of the academic sciences, such as economics, biology, history, English and other subjects that are the common knowledge of educated people—this is more or less obvious since a university degree is granted to graduates of the college; second, to give its students a knowledge of the sciences underlying the whole broad field of agriculture—that is the purpose of the prescribed under class courses and many of the upper division courses; third, to give the students a specialized training in his chosen major subject, such as citriculture or animal hubandry. It is believed that men so trained are ready to enter the agricultural profession and rapidly master its problems.

"Few people capable of serious and accurate thought question the value of either general academic or agricultural training, but many do hesitate to relegate the specialized training to third place. A college course is four years in duration, a brief time in which to expect to master any subject. The authorities of the college are of the opinion that in such a limited time it is impossible to do other than place specialized training third in importance.

"Returning now to the question of how much specialization the college of agriculture can and should offer, it can be said that wiser men than college seniors have failed to solve this problem. That this particular college of agriculture does not offer as great an opportunity for specialization as many others is an admitted fact. The division of animal husbandry, for example, is now severely criticized by many practical, successful stockmen over the state, because of this. Some of these men believe that the primary function of the college is to train milkers, herdsmen, or other types of skilled farm labor. A man who expects to farm is more efficient for knowing these details, but it is probably much better that he get this experience unaided by the college. Others expect that the college should train more businesslike farm managers. In this respect the more thorough a man's training the better, yet an agricultural college can go no farther than any other school in this respect.

"Law colleges do not graduate lawyers, nor colleges of medicine, physicians—merely the raw material from which lawyers and doctors are developed. Yet a college of agriculture is expected to graduate the finished product.

"Nevertheless it may be possible to give students of animal husbandry a more thorough training in fundamentals of the subject. The obstacles now encountered are the time taken by the more general training, and possibly a lack of equipment, and insufficient salaries to keep the teaching staff.

"We venture as a final conclusion that anyone having ah axe to grind will find upon investigation that the college of agriculture is accomplishing its purpose. It graduates the raw material from which the practical man, in any of the various agricultural pursuits, can be developed."

Without any desire to qualify as a critic, and at the same time declaring the nonownership of any axe that needs grinding, the writer has the temerity to offer a few personal opinions on the line of thought that runs through the editorial quoted. The writer believes that he entertains about the same idea as to what should constitute a course in agricultural instruction as is held by the average person, and that is that the primary function of an agricultural college is to teach agriculture, not to train milkers, herdsmen, etc. And believing thus it would seem that stress should be placed upon those fundamental sciences upon which modern agriculture is based rather than upon those "broad academic sciences such as economics, history, English and other subjects that are the common knowledge of educated people." We yield to no one in our appreciation of the value of such knowledge, but we believe that they should be given secondary importance in the agricultural course.

We do not agree with the statement that "law colleges do not graduate lawyers, nor colleges of medicine, physicians." It is true that graduates in those branches of learning lack the finish of experienced men, but they have been given the training that permits them to at once engage in the practice of their professions and furthermore no medical school that we are familiar with would attempt to give a course in medicine and surgery without the proper laboratory and clinical equipment corresponding to fields, orchards and livestock in agriculture.

Mind that what has been written applies more to training livestock men. It is possible that efficient men can be trained along other branches satisfactorily under the present system, but it would appear difficult. Not only is it difficult to graduate satisfactory men under present conditions, but it is certain that members of the faculty who are also members of the experiment

station staff could do a more useful type of investigation under a system that held out greater encouragement.

At the present time the institution is losing a number of the strongest members of the faculty. Some of these men are leaving because of greater financial inducements, but not a few are leaving because they feel that under existing conditions there is not much encouragement. At the same time, difficulty is being experienced in filling the vacant chairs. For one thing, more money is needed by the university in order to offer greater salary inducements—but it can not be doubted that on a number of occasions men have hesitated to connect themselves with the institution because of the rather limited opportunities under existing conditions.

The question of the desirability of making the change suggested, namely, centering the headquarters of the college of agriculture at Davis, presents many problems that will require careful and sound thinking. There are many advantages in having students in contact with university life. That is admitted. The question is: Is it better to continue furnishing that contact at the expense of an efficient course in agriculture or to recognize the unfortunate situation as regards the lack of a suitable farm at Berkeley and sacrifice the academic contact for a system that will give California boys as satisfactory training as the boys in other leading states receive?

Another problem that intrudes itself concerns the university farm school in the event that the college of agriculture was transferred to Davis. For some time there has been a question in the minds of many as to what real value could be attached to the farm school. As a matter of fact, the university farm school came into existence as a protest against the old type of instruction given at Berkeley without land, livestock or orchards. It was established with the idea of furnishing instruction in agriculture to boys lacking the necessary qualifications to enter the regular four year course.

The university farm school has pointed the way to a rational development of the college of agriculture. As stated above, much of the real agricultural advancement made in California dates from the establishment of that institution.

The Cultivator will welcome a frank discussion of this pressing problem in its columns. The question has been opened without malice and only with the hope that out of a sane discussion from all angles might come a constructive plan by which California boys will receive agricultural training the equal of any and that the college of agriculture will come to play a more important role in the agricultural affairs of this state.

RECLAIMING RANGE

The Chiricahua Cattle Company, which is the largest cow outfit in Arizona, has just completed one of the finest pieces of prairie dog extermination which has ever been accomplished in the United States. The area treated was one of the oldest established prairie dog towns in Cochise County and covered an area 12 miles long and four miles wide, or 30,720 acres.

Stockmen who are familiar with the area estimate that there were at least a million prairie dogs on the area before the work was started.

A crew of six to 12 men distributed the poisoned grain from February 26 to April 22, on which day the last dog was killed. Practically all of the prairie dogs were killed with the poisoned grain. but the few who refused it were located and exterminated with carbon bisulphide gas.

It is estimated that 35 per cent more grass will now be available for the cattle on the Chiricahua range.

ANNUAL MEETING AMERICAN GUERNSEY CATTLE CLUB

The Forty-third annual meeting of the American Guernsey Cattle Club was held May 12, in Chicago. The secretary reported that 18.8 per cent more Guernseys had been registered during the fiscal year 1919-20 thau during the previous fiscal year. The transfers show a gain of 35.8 per cent. A total of 167,458 Guernseys, 63,779 bulls and 103,659 cows, have been entered in the Herd Register. Seven hundred and eighty were imported during the year, 664 from the Island of Guernsey, 82 from the Island of Alderney, and 15 from England.

On May 1, 1920, 473 breeders in 33 states had 2,125 cows on official test, a gain of 74.2 per cent over the corresponding date one year ago. The Advanced Register contains 9,186 records that average 9.042.91 pounds of milk and 452.57 pounds of butter fat. One hundred and twenty-one names have been added to the list of Advanced Register bulls during the year, bringing the total up to 1,309. The membership list contains 931 names of active members, a gain during the year of 153. One hundred sixty-seven new members were added. Seven thousand two hundred and twenty-four breeders have registered Guernseys during the year. This figure does not include the large number of men who have purchased Guernseys and who have not yet registered the progeny. The members voted to increase the registration fees from $1.00 per animal for members and $2.00 for non-members to $2.00 per animal for members, and $3.00 for non-members. The increased revenue will be used for promotion work.

CALIFORNIA CATTLEMEN

A meeting of tremendous importance to the cattle industry was held Tuesday, May 18, at San Francisco. The price situation was discussed from every angle by prominent packers and representatives of the California Cattlemen's Association.

Here is a brief summary of statements made and conclusions reached at that meeting:

Prices are extremely low to cattle producers, while consumers are still paying the old prices.

To remedy this situation cattlemen should hold on to their stock as long as they have feed, and when feed runs short they should ship to other states where feed is available. C. N. Hawkins of Hollister, a director of the association, suggested that Montana was in the market for feeder stock, that state being 60 per cent short on its range cattle.

Packers urged that under no circumstances should cattlemen ship their stock to San Francisco on consignment because such shipments invariably pull prices down not only for that consignment but for all sales during that period. It was explained that the receivers of the consignment, having no interest in getting a higher price, let the stock go for anything they could get.

The sending of half fat cattle to market was deplored as a menace to the industry. This practice, it was declared, ruined the market for prime cattle. Such half fat cattle, it was agreed, should remain on the ranches or be shipped to Montana and other points needing feeder stock.

Fred H. Bixby, president of the association, said that in his opinion present market conditions were abnormal and he believed they would right themselves if cattlemen would refrain from glutting the market at this time.

Fred Washburn of the Western Meat Company said that the normal kill of cattle in San Francisco, Los Angeles and neighboring cities was about 36,000 head per month, that there had been no decrease in the demand and that it was up to the cattlemen themselves to remedy the present troubles, due to uncertainty of the supply. It was the opinion of all present that there was no oversupply of cattle on the all year basis, but that present troubles were due partly to the effort of too many producers to sell their stock at one season.

It was predicted that next fall would see a serious reduction in the number of cattle on hand in California and resultant shortage of beef during the fall and winter.

Packers asserted that they had lost from $5 to $35 a head on cattle killed during the first four months of 1920 and for this reason were somewhat wary of contracting now for cattle to be delivered in May, June and July. It was believed that better conditions would follow if cattlemen would hold on to their stock as long as possible, and where it was necessary to let go, ship them out of the state.

The cooperative buying proposition which has been outlined by the California Cattlemen's Association has been welcomed by the cattlemen in Inyo County, according to information received at the central office.

You May Not Wisely Delay
Ordering Your 1920

DE LAVAL
CREAM SEPARATOR

There are a dozen reasons why this is so.

For three years it has not been possible to make enough De Laval machines to meet the demand. More than ever are being made this year, but the demand is still greater.

Cream Separators have advanced less in price than anything else used or produced by the farmer during the war years. If labor and material costs continue to advance so must separator prices.

Such an advance must very soon come from increased freight rates, if from no other cause.

Freights are still slow and uncertain. There may be unavoidable delay in getting a machine when you badly need it from this reason.

The flush of milk and hot weather are near at hand, when a De Laval saves most and an inferior or half-worn-out separator wastes most.

There are still other reasons, which a De Laval best demonstrates for itself. You will have no difficulty in observing them. Every local De Laval agent will be glad to afford you the opportunity to do so.

If you don't know the nearest agent simply address the nearest main office, as below.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

June 17, C. W. Anderson, Burbank. Dispersal.

Duroc-Jerseys

July 21, Elmer Lamb, Ceres.
July, Conejo Ranch, Newbury Park.
July, Diamond Bar Ranch, Spadra.
July, Winsor Ranch, Bonita.

Hampshires

July, Conejo Ranch, Newbury Park.

Poland Chinas

August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J. Elliott and Alex D. McCarty, Tulare.

Professor Miles B. Kennedy, formerly of the University of Nevada at Reno, recently joined the California department of agriculture as dairy chemist. Professor Kennedy graduated from Nevada University in 1907 and for two years was instructor and analytical chemist at that institution and subsequently was appointed chemist to the state food and drug laboratory of Nevada, in which capacity be served until coming to California.

In the L. R. Hitchcock herd of Durocs at Van Nuys it would seem that nature is playing a lavish hand toward multiplying and improving the breed. Last two litters of 11 pigs each showed up just 16 sow pigs, and 15 of them saved.

At the J. C. Craig Duroc Ranch, Owensmouth, are now to be seen some of the real aristocrats of the breed, direct from the Middle West breeding grounds. Spring litters all in shipshape.

Manager Thos. T. Dinsmore of the Ortega Underhill Rancho, Santa Barbara, advises us that he now has definite plans for holding a bred sow sale in February. This arrangement will enable the management to concentrate attention most effectively on the type and character of Hampshires bred and reared along scientific lines at the home ranch. There are exceptionally fine strings of fall gilts now at the ranch that will fit in most admirably with this idea of exploiting the real achievements of the ranch work in the way of constructive work the past two years toward improvement of the Hampshire under ideal California conditions in the matter of size, stamina, prolificacy, as well as in the development of finer breed character and clean cut markings. Meantime there will be the regular fine display of offerings in young boars and foundation stock in a general way.

The Eastman Ranch, San Fernando, is one of the valley's up to date pure bred swine enterprises, with Homer L. Graham as superintendent. Mr. Graham's specialty is the big type Poland China—big type in blood and in fact. There are nine big matured brood sows on the place, with some of the most promising litters of the season. There are likewise 15 toppy and "typey" fall gilts that are held in reserve for breeding in November for March litters. The herd is representative of standard big type blood direct from noted Iowa breeding herds. Sire now in service is the big 14 months old Regulator 110998, son of the noted Liberator. This fellow is an outstanding individual in every detail, with maximum of bone and size. Buster Bob 382581 is another big March yearling that will be seen in the fall shows. He is a grandson of Giant Buster and a true bred Big Bob on dam's side, and is being developed for keen competition in the show ring.

Sunshine Ranch is one of San Fernando Valley's largest and finest foothill and valley farming enterprises, situated five miles west of San Fernando. It has 700 acres in two year old citrus trees, with an additional 200 acres of this year's planting. The big aqueduct passes through the ranch. There are foundation herds of registered Holstein cattle and Hampshire swine now installed, with complete equipment. There are two 60 foot concrete silos. This 4,200 acre ranch is to be the base for a Hereford cattle breeding enterprise on a considerable scale. J. R. Muir is the ranch superintendent.

Harry Gantz of Fullerton owns and operates a livestock breeding enterprise at Solvang, Santa Barbara County. Pure bred Hampshire swine and Ayrshire cattle are factors in the ranch prosperity. Mr. Gantz proposes shortly to introduce the best foundation stock to be had direct from leading herds of pure bred Herefords in the Middle West. The environment favors the building up of a great beef cattle enterprise.

A fine herd of registered Galloway cattle is owned by George M. Young & Son at Ojai.

With no less than 140 spring pigs in sight Newton's Arenal Ranch at Lankershim is one of Los Angeles County's up-to-date breeding establishments. A leading attraction in the Duroc section is a pair of 13 months old boars got by Crimson Colonel, and descending on dam's side from the great show sow, Enchantress. One of these is to be retained in the home herd and shown at the fall fairs.

Ten of the leading Guernsey cows at the Elliott-Brant Rancho are on test at this time with some very excellent records in the making.

The American Shorthorn Breeders' Association will hang up $1,200 in prize money for the Los Angeles Livestock Show this year.

At the final closing out sale of registered Holsteins held by J. M. Henderson Jr., at the state fair grounds, May 29, a general average of $210 was registered on a bunch of yearling heifers. J. W. Crawford of Burrell was the heaviest buyer.

One of the largest deals in registered Herefords was recently consummated when the Finnell Ranch Company of Galt purchased the entire herd owned by the Kiesel Estate in Oregon. The deal included 177 head among which are over 100 females of breeding age and the bull Beau Blanchard 37th, a son of the noted bull Beau Blanchard. The cattle will be shipped to the ranch near Galt and it is the intention of the new firm to build one of the strongest herds of the West.

A. W. Morris and Sons, Woodland, have recently sold to the Los Angeles County Farm, a year old son of King Korndyke Pontiac 20th and De Kol of Valley Mead 2d. De Kol of Valley Mead 2d, with a four year old record of 1,011.71 pounds of butter, is the dam of Miss Valley Mead De Kol, the dam of King Korndyke Pontiac 20th. This youngster therefore has exceptional backing and it is expected that he will prove a sire of high order.

California livestock men will be interested to learn that the University of California has arranged for the return of Professor R. F. Miller, for a number of years with the animal husbandry division. Professor Miller is now at the Texas agricultural college. Upon his return to this state he will become acting head of the animal husbandry division during the year's leave of absence that has been granted Professor Gordon H. True. Miller was formerly secretary of the California Wool Growers Association.

There has recently been organized the Merced County Pure Bred Livestock Association that has for its aim the promotion of better livestock in that county.

A. E. Lawson, Northwest field representative of the American Shorthorn Breeder's Association, attended the Caledonia Farms Shorthorn sale at Sacramento last week. Lawson said that he was very much impressed with the California herds he had seen and gave it as his opinion that there was bound to be a very wide extension of the business in this state during the next few years.

Alex Chambers, Forest Grove, Oregon, one of the veteran breeders of Shorthorns, attended the Caledonia sale and visited with the California breeders.

A new record price for an Angus bull was established at the Kershaw sale in Oklahoma last month when John C. Simpson of Muskogee paid $40,000 for the noted bull, Plowman. Plowman was sired by Glowman, an international grand champion, and his dam was sired by Black Woodlawn, known as America's greatest show and breeding bull. Seventy-one head of bulls and females in the Kershaw sale averaged $1,942.

In the Lookabaugh Shorthorn sale, held at Watonga, Okla., May 14, four 1919 heifers sired by Imp. Caledonia, leading herd bull at Caledonia Farms, West Sacramento, sold for an average of $1,469, which was the average of the sale—a remarkable showing when it is considered that in the sale were a number of older cattle.

The J. S. Gibson Company, Williams, report that the senior two year old daughter of King Morco Alcartra, Lady Prilly Alcartra, has just completed a record of 20.92 pounds butter from 541 pounds of milk. The above record is a splendid showing.

R. F. Fisher, manager of the Riverview Farm, Carlotta, reports the following records made in their herd of registered Holsteins: Sequoia Snowflake Segis, a junior four year old, 19.17 pounds butter from 462.6 pounds milk; Sequoia Pontiac Bess, junior three year old, 25.56 pounds butter from 591.1 pounds milk. In addition to the above seven day records, the following cows are being carried on semi-official test with the following production to date: Sugar Queen Topsy has the splendid showing of 687.5 pounds butter from 15,682 pounds of milk in 216 days; Amy Veedam Pontiac, 402 pounds butter from 9,943.1 pounds milk in 142 days and Sequoia Sugar Queen Hengerveld, a junior four year old, 376 pounds butter from 8,622.2 pounds milk in 147 days.

The third promotion sale of the Western Berkshire Congress was held at Calistoga, May 29. The sale followed the "Pig-nic" held by the farm bureau celebrating the successful close of the pig club contest. The first prize

One Man Saws 25 Cords a Day

The Ottawa Log Saw falls trees or cuts off stumps level with ground. Saws up logs, cuts up branches, ice cutter, runs pump jack and other belt machinery. Mounted on wheels. Easy to move anywhere. 10 Year Guarantee. 30 Days Trial. Write for Free Book and Cash or Easy Terms.
OTTAWA MFG. CO., 441 Wood St., Ottawa, Kans.

Big Producers Pay Big Dividends

Present Day Costs will eliminate all but most efficient producers. One hundred great females from high producing strains combine persistent production with type and constitutional vigor.

Two great bulls, Prince Walker Cornucopia and Merci Lad Korndyke Burke, will increase production of California dairies if their blood is introduced.

Profit Making Polands

Fast growing, easy feeding type Poland Chinas which will turn feed into gold are the type we raise. Size, type, vigor, prolificacy, easy-fleshing, quick fattening qualities, as typified in Anoakia Chief, sire of a bunch of youngsters out of prize winning dams.

A GUARANTEE

Santa Anita pedigree guarantees efficiency. Money making qualities are transmitted. Large number of animals to select from.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

Anita M. Baldwin, Owner Santa Anita, Cal.

in the contest was won by Ted Wright on a Berkshire boar. He was awarded a medal by the congress in addition to the prize offered by the farm bureau. In the sale 15 Berkshires were sold. The offering consisted of sow pigs and a few bred gilts. The top gilt was from the Grapewild herd of A. B. Humphrey, Escalon, and was sold to J. F. Ratto, Napa, for $130. The prices paid for the balance of the offering ranged from $50 to $90. This was the third sale held this spring by the Congress through which more than 40 Berkshires have been placed on farms in Northern California. The next sale will be held at Salinas during Rodeo week.

The following report from Anchorage Farms, Orland, proves that it is almost impossible to estimate the value of a good sire. Mrs. Hardy recently sold five weanling sow pigs by Natomas Baron Duke to R. P. McDonald, Potlatch, Idaho, for his ranch at Choteau, Montana. The price was $90 each. Also a weanling boar pig by the same sire to R. N. Blackmer of Medvale, Utah at $150.

J. H. Cook, Paradise, has sold his Forrestview Ranch and is soon to be located on his ranch in the valley north of Chico. As soon as convenient after getting established in his new location, he expects to increase the size of his herd by adding several very high class sows. A sow of Repeater, first prize junior yearling at the National Swine Show, is the latest addition to the herd.

W. F. Sandercock has purchased from Balley McFarland of San Mateo County, his entire herd of "Epochal" Berkshires. This consists of herd boar Steyhrae Epochal, eight mature sows, four fall gilts and 50 suckling pigs. This herd will be added to the herd which Sandercock is now carrying on his Natomas lands. The sows are all sired by the Champion of England, an imported boar that was grand champion of England. They are closely related to the sensational show herd which the Gossard Breeding Estates showed during the 1919 season. The herd boar has been pronounced as a very remarkable individual by those in authority and L. E. Frost, editor of the "Berkshire World" stated that he was one of the two best boars ever sired by Epochal. Interesting results should be secured by the judicious use of this English blood on the prize winning stock now on Sandercock's ranch.

The winning pig in the recent high school boys' feeding contest at Van Nuys was owned and fed by Edwin B. Angier. This September gilt was a pure bred Duroc, being one of a litter of 11, nine raised, and out of the fine brood sow Arenal Lady 775748, formerly owned at the Arenal Ranch at Lankershim. In this connection it is worth while to note that the duplicate pedigree record for every sow and litter at Arenal Ranch is kept on display at the ranch. Perfect system is the rule and the pigs will talk for themselves.

Secretary C. R. Thomas of the Los Angeles Livestock Show is recognized as a conservative authority in forecasting probabilities for the big October event. The promise for entries in all departments exceeds that for any previous year. The national Shorthorn, Hereford and Aberdeen-Angus Associations are all to take an active part. The swine show should be a big one, while the displays in goats and poultry will be quite up to the Southern California standard.

J. L. Stevenson at Van Nuys has at head of his Echo Ranch herd of Durocs one of the very excellent sons of Great Model. His dam is of Golden Model blood lines. This young boar was raised by Stevenson, and he is the pick of one of the best of litters seen in San Fernando Valley last year. He stands perfectly on legs and feet and his top line is without a flaw. Stevenson will show up a fine string of litters on the home stretch this fall.

The San Fernando Valley Fair and Market, Inc., is to be made an important factor in the development of the valley's livestock interests. A four day's fair is planned to be held at Owensmouth, September 15 to 18, with C. L. Schufeldt as manager. Public sales of pure bred livestock will be held during the week.

V. F. Dolcini, owner of the June Acres herd of Duroc-Jerseys, has recently sold two fall boars, both sired by Model Colonel, the boar formerly at the head of the university herd, to C. Signorelli of Guadaloupe, and a boar of like age but sired by Great Wonder's Model 3d to Lincoln White of Sacramento.

Professor F. W. Wilson of the University of Nevada, and Jos. Wilson, farm adviser of Lyon County, expect to leave shortly for New Zealand for the purpose of selecting 200 head of Corriedale sheep for Nevada sheepmen. The importation is expected to arrive in this country about August 1.

The Sonoma County farm bureau is arranging to hold a sale of pure bred dairy bulls in the near future. It is expected that the sale will attract consignments from each of the standard breeds and prove a means of distributing a better class of bulls in that county.

C. E. Howell, who has been assistant professor of animal husbandry at the state college of Washington, has resigned to take over the management of the J. J. Stevens Corporation Farms at Newman.

The Breeders Gazette published the following letter from their Glasgow correspondent: "Some excellent Aberdeen-Angus have recently been bought in Scotland for exportation to the United States. One of the principal lots has gone from the herd of James Kennedy, Doonholm, Ayr. Five have been acquired by James Marwick, Braemar Ranch, Santa Barbara, California. One of them is Belinda of Doonholm, a full sister of Biota of Doonholm, the champion of the 1919 Edinburgh show of the Highland and Agricultural Society of Scotland. Belinda is by Mondello, a son of the noted Evarra, and out of Belshan by Price List. A second heifer is Energica, by Matador of Bywell, which was first in his class and reserve champion at the show of the Royal Agricultural Society of England, out of Energea by Mondello. Equatora is another of the lot. She has for top crosses such sires as Matador of Bywell, Mondello, the great Evarra, and Prior of Bleaton. A fourth heifer is Eurugina, bred upon similar lines, with the famous Mailhag as her fourth sire. Along with these heifers there goes to Mr. Marwick the bull Electo by Elect of Doonholm, exported at a long price to the Argentine, and out of Elvega by Mondello.

The promotion sale held by the Western Berkshire Congress at the university farm, May 20, proved to be a bargain day for the few buyers who attended. A very satisfactory offering had been selected from nearly all of the principal herds of Northern California, and it had been hoped that greater appreciation would be accorded the efforts of the officers of the congress to give a wider distribution to Berkshires. Professor Thompson, buying for the Kamehameha School of Honolulu, topped the sale when he paid $125 for Rincon's Queen, a junior yearling gilt consigned by H. C. Muddux and Son, Sacramento. Professor Thompson secured two other gilts for the same school. Other buyers included J. Francis O'Connor, Santa Rosa; F. W. Sandercock, Sacramento; A. B. Humphrey, Escalon; H. C. Muddux and Son, Sacramento; A. J. Smittgen, Sacramento; Bruce S. Bennett, Sacramento; Ord. L. Leachman, Sacramento; George Murphy, Perkins. Cols. Leachman and Snook of Sacramento, were the auctioneers and the sale was managed by Bruce S. Bennett, field secretary for the congress.

SILO BUILDING TIME HAS ARRIVED

Before long the housewife in town and on the farm will begin to make plans for canning fruits and vegetables for next winter's food supply. Why shouldn't the dairy farmer make a similar provision for his cows by building a silo and planting a crop to fill it, asks the dairy department of the University of Missouri college of agriculture.

The silo can always be considered a sign of prosperity. Whenever one rides through any country community and finds the landscape dotted with silos, he immediately "sizes up" the community as a prosperous one because it indicates at once that large numbers of livestock are kept and it also shows that the farmers are far signted, looking to the future.

The silo is one of the most economical buildings on the farm and it gives excellent results. According to a recent issue of Hoard's Dairyman, "the silo is the best and cheapest form of providing succulent winter feed. It is the cheapest farm building we can erect. It will house feed nutrients at a lower cost per ton than the hay mow in the barn, will protect a like feeding value in the form of hay or other roughage from the weather. It increases the producing capacity of the farm at least ten per cent and will often increase the stock carrying capacity 25 per cent. It is the cheapest place to store the corn crop, for an acre of corn can be placed in the silo at a cost not exceeding that of shocking, husking, grinding and shredding and it will preserve more feed nutrients and produce more milk per acre than any other system of handling. It saves a third of the value of the corn that is otherwise largely wasted. It requires less labor to feed silage and there is less waste of fodder by the cows."

How to Select a Silo

Oregon Agricultural College Experts Give Advice

Seven Essentials from O. A. C. Bulletin No. 136.

1 *Diameter should be limited.*
Diameter Indiana Silos 8 to 20 feet. Height 20 to 40 ft. Special sizes to order.

2 *Foundation should be of proper width to carry weight upon it.*
Indiana Silo foundation is concrete. Exact instructions mailed day order received.

3 *Inner walls should be smooth, perpendicular, free from corners; other than round types not satisfactory.*
Indiana Silo straight-edge staves finished both sides. Air-tight tongue and groove joints, beveled to fit curve. Factory built, bolted door-frame insures perpendicular wall. Indiana Silo is round.

4 *Inside should be painted with tar pitch, melted or thinned with gasoline before applying.*
Smooth finish, No. 1 Fir staves absorb protective coating. Indiana Silos are easy to paint.

5 *Doors should be of such construction as to be easily removed.*
Indiana Door-frame construction patented. Made-up air-tight doors interchangeable. Compression cam lock. No hinges.

6 *A ladder should be provided at such distance from silo wall as to permit easy climbing.*
Steel door-levers, 6 inches from wall, make ladder. Easy to climb. Indiana Silos have no expensive useless parts.

7 *A good roof adds to life of silo and adds greatly to appearance.*
Indiana Silos equipped with roof. Rafters and sheathing cut, cedar shingles. Door section made-up.

Indiana Silos meet the most exacting requirements.

Damage by Rodents

By W. C. Jacobsen

THE rodent control division of the state department of agriculture is interested primarily in ground squirrels, pocket gophers, meadow and field mice and rabbits. We would be making a conservative estimate of all rodent loss if we placed it at $50,000,000 for California during the last year at present high prices of field and forage crops. There is no doubt in my mind but that it would be considerably more than this if we were inclined to go deeply into the subject to root out the actual losses occasioned. Unfortunately, California is so large that we cannot get actual figures for each locality.

In 1917 we made the statement that ground squirrels in California did approximately $30,000,000 worth of damage. Owing to the systematic and efficient work in many of the counties by county horticultural commissioners we have felt that it is quite possible to cut that loss down to $20,000,000 at the present time. Of course, there are localities where the residents would not agree with this, because they have not noticed the marked change, but take the state as a whole and we find that there has been a very considerable diminution in their numbers.

The museum of vertebrate zoology, after having taken a very careful mammalian census, placed the average number of mammals per acre in California at 20, 18 of which were rodents and at least one a ground squirrel. This does not mean our California digger ground squirrel but a representative of at least one of the 18 different species would be found on some one acre in California. The acknowledged damage by a good, healthy ground squirrel on range land is placed at between 25 cents and 35 cents per year. This covers not only the actual damage that is done by destroying food crops or forage plants, but by storing seeds which are prevented from germinating. In a grain field or an orchard the damage would run from $2 to $10 per head. Then again, there are ground squirrels in desert areas where the destruction amounts to practically nothing. For sake of convenience we have made this statement: should a single ground squirrel do but a penny's worth of damage once every 12 days, or approximately two weeks, in the course of a year that would mean 30 cents per head. There is no question as to the penny's worth in two weeks for this is ridiculously low. There being one ground squirrel to the acre, 100,000,000 acres at 30 cents would result in $30,000,000.

The estimated damage for pocket gophers is about $15,000,000 for this state. Last month I was witness to an area in Tulare County that was being flooded as a result of a freshet from the Kaweah River which normally has a very small stream of water in it, if any at all, where gophers had undermined a levee and the water was pouring in three or four feet from the base of the embankment on the open field side just as if it were coming out of an artesian well. Three such places (as there actually were) in the space of 20 feet meant that it would not be long before this field would be completely flooded. Fortunately, this particular area was not being cultivated but there were many fields adjacent that were. This is just an example of what damage a pocket gopher might do which ordinarily is not considered in the general run of destruction. When you can find 300 trees in their second or third year's growth completely destroyed by pocket gophers on a small area of 200 acres, being repeated not once but many, many times, you can readily understand how the damage by pocket gophers can be placed at that high figure.

It might be asked how the damage from rodents has increased so enormously in many of the localities in past years, and may be a word as to this reason would not be amiss here. In the first place, the natural enemies such as hawks, owls and snakes have been forced out by civilization and in many cases ruthlessly destroyed without adequate knowledge as to whether they were harmful or beneficial. This served to release a certain check that had been placed upon these rodents by nature. On the other hand, cultivation produced a food supply which was far handier and more readily available to the rodent. Increased food supply means increased rate of reproduction in the case of almost any mammal. Hence, these two factors have made things favorable for the rodent pest. Control of these pests is as much a part of farm work as is cultivating the land and putting in and harvesting crops. And perhaps the largest land holdings that are still allowed to remain vacant or those that are held for grazing where the stockgrower looks upon the presence of rodents as a sort of a necessary evil will eventually realize that in many instances 30 per cent to 50 per cent of the feed is taken by rodents. It is not the amount that is actually taken annually but rather the amount that is destroyed by preventing seeds of valuable forage plants from germinating over a period of years.

THE IRRIGATION OF POTATOES

By W. V. Shear

Proper attention to irrigation is a most important factor in the production of large crops of potatoes and also in the production of potatoes of high quality. "Hit or miss" methods of irrigating potatoes are responsible for great injury to the plants and hence affect the yield and character of the tubers. A common opinion prevails that potatoes will do well with a small amount of moisture. This is due to the fact that in some sections of California good crops of potatoes are produced without irrigation. These localities, however, are so located that irrigation is for the most part impracticable and does not prove that larger crops would not be obtained through the use of moisture. The potato plant can "get along" with a small amount of moisture in the soil in localities where the weather is cool and where fogs are more or less prevalent. In the warmer and dryer sections of the state, the plant should have an abundant supply of water to produce maximum crops. In such localities irrigation not only supplies the needed moisture for the plants, but it also keeps the soil cool, which is an important matter in the production of potatoes. However, good drainage must accompany the application of water, as the potato plant abhors a "soggy" soil.

No uniform rule can be laid down with reference to the length of time which should elapse between irrigations. The ideal condition is to furnish the plants with a uniform amount of water throughout the growing season and only by a careful examination of the soil can the potato grower determine when more water should be applied. It is not wise to attempt to determine by the appearance of the plants whether they need water or not. To wait until the foliage wilts and turns a dark green color is to wait too long. It must be remembered that it requires considerable length of time to irrigate potato fields properly, and often a couple of days of very warm weather will cause very great injury to the plants and an injury which can never be remedied. Of course if such an event takes place it may be wise to continue to give the plants water, but if the tubers have attained much of any size, water applied after this time is almost sure to result in uneven ripening of the plants and also in knobby and misshapen tubers. The potato grower should watch his field almost daily and determine by actual digging into the soil with his hands whether or not more moisture is required. It is best to irrigate with a very small stream through every furrow and allow the water to run perhaps 24 hours.

The Combination for Engines that Pump Oil

In addition to preventing fuel from wasting past them, piston rings should regulate and control the flow of lubricating oil to prevent it from fouling spark plugs and causing carbon deposits.

In engines where the flow of oil is excessive it has been found necessary to install a McQuay-Norris Superoyl Ring in the top groove of each piston with McQuay-Norris Leak-Proof Piston Rings in all other grooves.

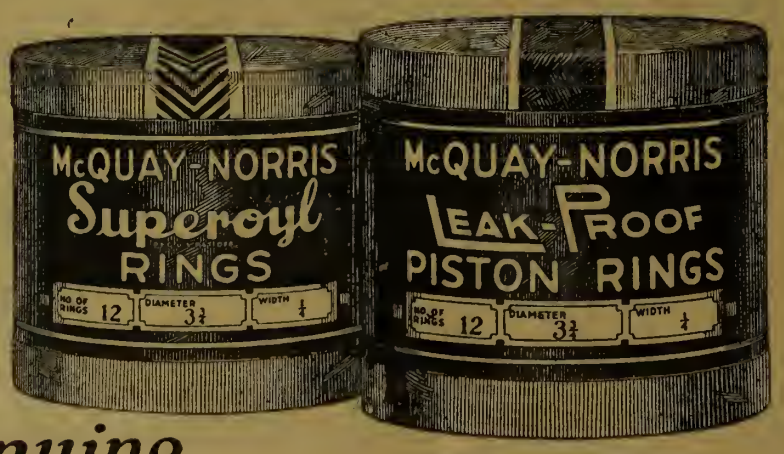
This combination of time-tested Piston Rings increases your engine's power by insuring equalized cylinder compression, saves the waste of gasoline and lubricating oil, and decreases carbon and fouled spark plug troubles.

These are the only piston rings of their kind. They are made in every size and over-size to fit every make and model of gas engine. Repairmen everywhere can furnish any desired sizes promptly. If he hasn't them in stock he can get them within a few hours from his jobber's complete stock.

McQuay-Norris Mfg. Co. St. Louis, U. S. A.

Write for This Booklet

It explains the construction of both of these McQuay-Norris Rings and gives you a clear, non-technical explanation of the principles by which motor power is efficiently developed. Address Dept. AB



—the genuine

7

rather than rush the water through rapidly. It takes a long time for many soils to absorb water laterally across a row of potatoes.

The proper irrigation of potatoes is an art rather than a science; that is, it is only acquired through experience. An attempt should be made to moisten all the soil to within two or three inches of the top of the ridges without saturating it. If for any reason flooding occurs anywhere in the field, every effort should be made to drain off the excess water as rapidly as possible, as it takes only a short time to drown a potato plant.

The stage in the development of the plants at which time irrigation should be discontinued depends upon when it is desired to market the potatoes. If the grower chooses to get a maximum crop by allowing the plants to mature normally, irrigation should continue as long as it is necessary to keep the soil moist until the plants show, by the yellowing of the foliage, that they are maturing. This should be done regardless of whether or not it is necessary to continue the irrigation after the plants are in bloom. In some localities where soils are very retentive of moisture and where the weather is cool, it may not be necessary to irrigate after the blossoming period, but on most of the soils of the state it is advisable to irrigate later than this.

If the grower desires to harvest his crop early in order to catch a better market, it may be wise to withhold the water when the potato reaches marketable size, in order that the tubers may mature more quickly.

LIMA BEANS

Manager R. L. Churchill of the California Lima Bean Growers Association writes: (Delayed from last week.)

Replying to your letter will say that regular Lima beans are being quoted and sold regularly by our association at price of 12 cents f. o. b. cars common shipping points in California with a bonus of 15 per cent of amount purchased free f. o. b. coast, making price equivalent to $10.43 per hundred weight. Independent shippers are quoting and selling at from $10.30 to $10.50 per hundred weight. We are selling Baby Limas at same quoted price as regular Limas but with bonus of 20 per cent instead of 15 per cent, making price equivalent to $10 per hundred weight f. o. b. coast. Only a few thousand bags of Baby Limas are now remaining in stock unsold in California although some sales have been confirmed for June shipment. It is now certain that all Baby Limas remaining will be sold and very probably be shipped out of California not later than the middle of July.

The stock of regular Limas remaining on hand here on the coast, while considerably larger than the Baby Limas is considerably smaller than the stock on hand last year at this time, and if the buying and shipping demand should continue even at the same rate that has been current during the past two or three weeks the greater portion of the stocks will be sold before the crop now being planted matures and there is a good chance that a better demand will develop in the next few weeks which may easily clean up the entire stock.

CONTROL OF WILD ANIMALS

By W. C. Jacobsen

We have on file in the state department of agriculture petitions from various localities requesting some assistance in the matter of predatory animal control where calves, sheep and all manner of poultry have been taken by coyotes and bobcats. Perhaps the largest source of damage from the mountain lion is the killing of deer in the mountain regions.

Within the last few weeks the rabies situation has developed in the south San Joaquin Valley, and while no predatory animals have been found infected with the disease, dogs and several head of livestock have succumbed to the disease and it is barely possible that it is being transmitted by coyotes. If not, there is no reason why it would not soon spread to those members of the dog family. If such be the case, the problem will be a far more serious one to deal with because control of these wild animals is far more difficult than with any domestic forms.

California has paid out countless thousands in bounties for these predatory animals, and if we could check up this sum in the various counties, I think that we would find that it would total millions. If such is the case, the damage occasioned by this pest would be found to multiply this amount actually paid out several times. For that reason we have ceased to look kindly upon this manner of attempted control, because it is partial at the best and in areas where the bounty has been prevalent for years reinfestation has occurred to such an extent that it is necessary to reestablish the bounty where discontinued or resort to other means. We have tried to present the seriousness of the situation to the legislature and last year were partially successful in that one bill was passed by the the legislature calling for a report to the governor in November, 1920, on predatory animal losses and methods used in other states for their control.

We hope by that time to have more definite and accurate information as to the actual losses. At present it is possible only to venture a guess and I personally would not like to do this even though I might have a fairly good idea of the losses actually occasioned. We have a plan to replace the county bounty system, and its success has been proved in other Western states and also in parts of California to such a degree that it can be established throughout the state. Rather than pay out the sum that has been expended annually in bounties, devote the same amount, together with state and federal appropriations for the same purpose to the inauguration of a systematic hunting, trapping and poisoning campaign.

THE RAT MENACE

Rats are almost entirely pests in centers of population where there is waste food and material for them to eat. This is rather a problem for the health officials in cities than it is for the farmer. Where grain is stored rats and mice do some damage and it often amounts to millions for agricultural products alone, but most generally it is the town and the city that must consider this problem The most serious problem that confronts us from these pests, particularly the house rat, is its habit of harboring innumerable fleas which can readily transmit bubonic plague. Not only have they been the source of this disease in the city of San Francisco, but they have transmitted it to the squirrels, against which the public health service is now carrying on a hunting campaign to determine how serious the infection is in the counties immediately surrounding San Francisco Bay.

LOSS FROM INSECTS

Insects are the most formidable enemies of the fruit grower. The horticultural department at Cornell University, Itbaca, New York, says conservative estimates place the annual loss to the fruit crops of the United States from insect pests at from 20 to 40 per cent of the total. Quaintance estimates the annual loss to the deciduous fruit interests of the country from insect depredations at $66,114,650. Of this amount codling moth was responsible for $16,716,667 and San Jose scale for $10,528,265. Other leading pests were plum curculio, $8,590,769, and peach tree borers, $6,000,000. The greatest loss falls on the apple growers, for in addition to the codling moth loss herein recorded, miscellaneous apple insects cause a further loss of $10,089,932.

That great riding comfort
found also in the New Mitchell

WITH all the betterments in the New Mitchell, we have not changed the suspension. We retain those famous cantilever springs that have already won approval everywhere.

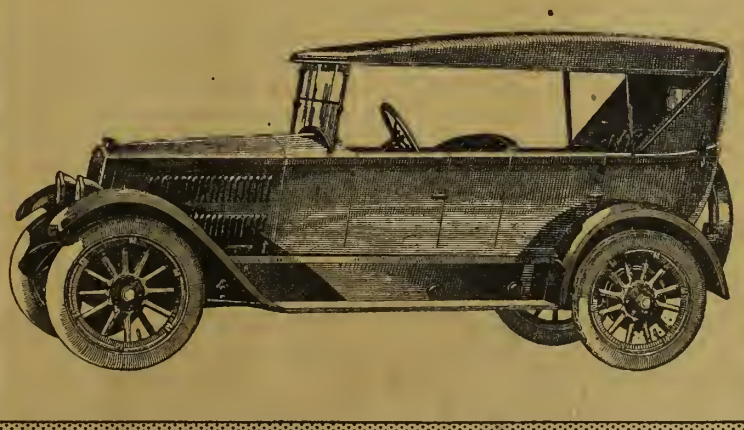
Bodies are roomier, upholstering is finer and deeper—but it is impossible to design or make springs that are better. On thousands of Mitchells these especially designed cantilever springs have proved their worth. They bring the utmost in comfortable riding. And they never break.

The New Mitchell looks new and is new throughout, with such few exceptions as above.

Note the new body lines, bringing the latest and accepted style. Note the fine top, the real leather upholstery, all the equipment.

Then, like everyone else who inspects this creation, you will recognize its over-values. We are able to offer you a better car at a fair price because we built it *complete*. We do not assemble.

The New Mitchell is the sensation of the year. It is selling faster than we can build. That means that you should investigate it before you buy.



Mitchell

Built to stay new

THIS has been our idea in car building for four years. We have developed it to the limit. We have been able to prolong newness. By building with better materials, by adding extra finish.

We are able to build in those lasting qualities because we supervise every process, from buying raw materials to the completed job. We are not dependent upon outside parts makers.

So we not only save money for you, but we guard your interests in building for you a real economy car.

Upkeep and operating costs have been brought to a new minimum. We know, because our parts department has reached a low ebb in replacements.

The body as well as the mechanical unit is built to stay new. We build the bodies ourselves. We add extra strength, extra braces. We go to extremes that are rarely practiced in cars of this price. A finer body is impossible, for we follow, and have created, some of the accepted standards of custom building.

For a long-life, comfortable, economical and stylish car — at a saving in initial cost, as well as later, this New Mitchell commands your attention. We do not believe that you can find its equal at the price.

Go to a Mitchell dealer, make comparisons. See what this New Mitchell offers. Then, if you agree that it is the finest car at the price, place your order early, so as to insure early delivery.

MITCHELL MOTORS COMPANY, INC., RACINE, WISCONSIN

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 35,000 subscribers. Weekly Liner rates: Single insertion 3½c per word; 35c per issue minimum charge.

My Victor Herd — Headed by Billiken Chester Whites. For quality and big litters. E. E. Fulton, Box 7, Fair Oaks, California.

BACTERIAL WILT OF CUCURBITS

Infection with the bacterial wilt of cucurbits does not occur through soil or seed. The striped cucumber beetle and the 12 spotted cucumber beetle are both summer carriers, and probably the only means of summer transmission of the disease in the localities that have been studied. Introduction of virulent bacteria into the interior plant tissues is necessary for infection.

These points are given in a recent United States department of agriculture publication detailing the results of studies on the disease, which occurs in 31 states, including the territory from Vermont and Canada to Florida and west to Minnesota, Nebraska, Colorado and Texas. The disease also probably occurs in parts of California. Of the common domestic cucurbits the disease affects cucumbers, cantaloupes, summer and winter squashes and pumpkins, but not watermelons.

Control Measures Recommended

Spraying with strong Bordeaux mixture and lead arsenate paste (4-4-50 plus 2) is recommended where the disease is likely to be severe. Treatments should begin as soon as the cucumber plants develop their first true leaves and should continue at intervals of about a week until the cucumber beetles practically disappear from the field. In localities where downy mildew is also prevalent the treatments should be continued later as a partial insurance against this disease. The beetles prefer unsprayed plants as food, and undoubtedly the efficiency of wilt control would be enhanced if a slightly earlier trap crop, such as squash, were planted along the edges of the cucumber field. The beetles could be easily poisoned there with a strong insecticide.

Pulling of wilted vines during the first part of the season, or as long as it can be done without mechanically injuring the healthy plants, will greatly assist in controlling bacterial wilt if consistently done in all neighboring fields. The diseased vines should be buried or otherwise removed from access by the beetles.

Screening in Garden Plats

Where a few plants only are grown in garden plats, screening the hills with fine mosquito netting will prevent the appearance of the disease.

For control in greenhouses the beetles, in the first place, should be kept out. Do not grow cucurbits nor pile cucurbit refuse in the immediate vicinity of greenhouses, as this attracts the beetles and many will later find their way into the houses. If the beetles once gain entrance to a house filled with growing plants hand picking is the only remedy to be recommended until some fumigant is found that will kill the beetles without injuring the cucumber plants. Besides destroying the cucumber beetles, great care must be exercised in disinfecting all instruments used in pruning wilted vines before using them again on healthy plants. This may easily be done with a bottle of one to 1,000 mercuric chloride and a sponge.

NEW COTTON FIELDS

The London Morning Post of April 5 contained the following interesting item relative to the proposed large scale cultivation of cotton in Mesopotamia:

The British Cotton Growing Association recently sent a deputation to Mesopotamia to survey the country there and to report as to its value for cotton growing. The report was satisfactory, and it is now proposed to set up a number of model plantations which will serve the purpose of seed and demonstration farms.

The possibilities of Mesopotamia for cotton growing are said to be very considerable, but its potentialities have yet to be investigated and put on a test to decide whether cotton growing can be established there on a commercial basis. The rainfall is so small that the summer cultivation of the country must depend entirely upon irrigation. Mesopotamia, it is said, differs from Egypt as regards the conditions under which the work of irrigation will have to be carried out. The irrigation system is dependent not on a single river with a well defined and permanent course, like the Nile, but on two great rivers—the Tigris and the Euphrates—meandering through a wide plain in very ill defined and frequently changing courses, with many tributary branches and cross connections.

Sir William Willocks states that Mesopotamia is the home of perennial irrigation, and he emphasizes strongly the fact that at no period in its history has the whole of Mesopotamia been under irrigation at one time. "It does not seem likely," he says, "that more than 3,000,000 acres would ever be available for cotton commanded by summer irrigation. Cotton is a summer crop, and if the rotation adopted is one year's cotton in three that would mean about 1,000,000 acres under cotton."

Next year it is hoped, with government assistance, to begin work on cotton growing in Mesopotamia on a large scale.

IF THE PINK BOLLWORM INVADED CALIFORNIA

No better object lesson may be had of the value to agriculture of the California quarantine and inspection service than a brief recital of the havoc produced by the inroads of the dreaded pink bollworm of cotton. Conservative estimates of economic losses produced by the pink bollworm through reduced yield in lint, light seed and inferior oil may be understood better from the following:

Official reports from the Egyptian department of agriculture place their losses at 20 per cent.

Losses in Brazil are estimated variously at from 30 to 66 per cent of the crop, in some states running as high as 80 per cent.

In the Laguna in Mexico the estimated loss is placed at 30 per cent.

The cotton industry of Hawaii has been wiped out.

China reports the pink bollworm on the increase and to date no accurate figures as to losses are available.

U. S. Would Fare No Better

There is no reason to anticipate that the United States would be any better off than any of these other countries should this insect become widespread and fully established. On the other hand, cotton growers in the Southern states would have the additional disadvantage of the cotton boll weevil which does not occur in any of the competing cotton producing countries of the world other than Mexico.

The possibility of damage from this insect in this country is further indicated by the similarity of climate in the Laguna and in the central and northern ranges of cotton culture in China to that of our Southern states. This possibility is emphasized also by the actual abundance which this pest had reached in the worst infested fields in southeastern Texas in 1917 and in the worst infested fields in Cameron Parish in 1919, an abundance which had by no means reached its maximum but was yet sufficient to have occasioned a considerable percentage of loss to the crop. For example, in the worst attacked fields referred to in 1917 and 1919, approximately 75 per cent of the late and immature bolls were infested.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Santa Cruz.—High pens for the week ending May 15: Geo. Gray, Santa Cruz, 55 eggs; Bellows Bros., Lakeside, 55; G. G. Barker, Santa Cruz, 55; S. L. Gibson, Santa Cruz, 54; R. C. Gibson, Newhall, 53; B. F. Rose, Santa Cruz, 52; D. B. Walls, Petaluma, 51; Theo. Clark, Santa Cruz, 51. The per cent of production for the flock was 64.

AN INTELLECTUAL STATE

"Father," said the boy, "what is an ignorant idealist?"

"An ignorant idealist, my son, is a man who gets his mind so set on what he is thinking about that he does not always see the necessity of knowing what he is talking about."—Washington Star.

How to Kill SCALE
All Summer

Scale hatches all the year and multiplies very rapidly. Soon after hatching it feeds, then attaches itself to the tree AND NOTHING TRIED SO FAR KILLS IT when at this age. Fumigation will kill the newly hatched scale for the fifty minutes, when being applied, but what about the unhatched scale? It takes an INSECTICIDE thoroughly covering the tree to keep the young scale killed. THAT IS WHAT T-I-Z-I-T SPRAY WILL DO.

It also controls Red Spider, cleans the tree of fungus growth, stimulates the tree and cleans the fruit. Write us so you can see how well T-I-Z-I-T works in the grove nearest to you where T-I-Z-I-T has been used. Interesting pamphlet on request.

Feed and Eggs

By Jean A. Koethen

"I SHOULD like to see some discussion on the effect of various feeds on the quality of eggs," writes a Tancred subscriber. "One man who was shipping choice eggs to a certain firm had some cases returned with the complaint that the yolks were of a greenish color and was advised to take the hens off alfalfa or allow them less.

"Last season a neighbor shipped some eggs in my name. Word came to me that they did not seem like my eggs and suggesting that the shipper should shut his hens away from grass to make the quality as good as mine. The fact was that my hens had, if anything, more green feed than those of my neighbor. They not only helped themselves in fields and roads but I fed chopped greens daily. Both lots had about the same whole grain. The difference was that I fed Surelay and mill run, while he did not. Did this mash account for the difference in quality?"

In order to get at the effects of different feeds on eggs, or rather the purpose for which different feeds are used, we must remind ourselves that an egg is composed of four substances —protein, fat, water and mineral matter. Sixty-five per cent of the whole egg is water, and the protein content varies from less than 12 to more than 13 per cent. About ten per cent is fat and the remainder is mineral matter or ash. This latter includes the lime in the shell, sulphur, phosphorus and infinitesimal quantities of other mineral substances. These mineral ingredients are found to some extent in all grains and also in alfalfa and other green feed. Fat is also found in all grains. There is never any difficulty in supplying the hen with the necessary fat for the yolk of the egg. The problem is to keep down the amount of fat lest the hen put it on her own body instead of into the egg, and to supply sufficient protein for the white of the egg.

Can't Produce on Greens

Not only must the hen that is expected to produce heavily be a large eater, but she must be provided with the right kind of feed. Hard grain will not do. A diet of unground grain exclusively supplies too much starch and fat and too little protein. Green feed will not do. You might as well expect a farmer or mechanic to do a day's work on a diet of lettuce salad as to ask a hen to produce eggs from green feed. There is protein, to be sure, in green feed, especially in alfalfa and clover, but only a little, and the hen requires a good deal. In order to get any appreciable amount of protein from alfalfa, she would need to eat so much that the yolk of the eggs surely would be green, and even at that she would not produce many eggs. Hard grain and greens together are better than either alone, but the necessary amount of protein is still lacking.

In order to fill this protein requirement and to provide it in such form that it can be digested with ease, the mash has been devised. A hen can eat more ground grain than she can whole grain because the first step in digestion (i. e., grinding) has already been taken. If to the ground grain is added an animal meal with high protein content the hen has the materials for egg manufacture right at hand in shape for immediate and heavy consumption. On all commercial egg ranches where high production is the first aim a mash is kept before the hens, and they are encouraged in every way to fill their crops and keep them full. The general practice of turning on lights early in the winter mornings has just this one purpose, to induce the hen to begin eating a little earlier and to fill her crop a little fuller than she otherwise might.

Egg Material First

Now the point of all this is that the hen must be provided with material for eggs before she gets a chance at green feed. Very little hard grain, if any, is fed in the morning on a modern egg ranch. The hen scratches in the litter for any stray grains from last night's feeding, but the bulk of her breakfast is mash, and she is expected to eat mash till noon. By this time the edge of her appetite is dulled, and while she may attack vigorously the noon meal of greens she is soon satisfied. Turn her on the alfalfa, if you like, after three o'clock, and she will not eat enough to affect the eggs or her own production. Turn her out in the morning and she will fill up on alfalfa to the detriment of the quality of her eggs.

Green feed is for health, not for the manufacture of eggs, and I am constantly surprised to see how little green feed hens that have mash always before them will consume. They like to pick and taste and nibble, but they do not seriously devour it as they do grain and mash. A hen knows what she needs, but like a child that spoils its appetite with cake and candy if given a chance, she will eat too much green if green is offered first.

We are not told just how the mash and the grain were fed in the instance quoted, but unquestionably the hens that had no mash, even though they had all the whole grain they would consume, had less grain than the mash fed birds and hence were able to consume a good deal more green.

Generally speaking the grain a hen eats is used in the fat of the yolk and to a small extent in the white; the meat (protein) makes the bulk of the white; lime goes into the shell, and green feed tints the yolk. Strongly flavored feeds, like onions, will flavor the whole egg, if liberally fed, and green feed to the exclusion of mash makes a very dark yolk.

POULTRYMAN'S CALENDAR—JUNE, KEEP AFTER THE MITES

In no other month do mites breed so rapidly as in June. If they have been allowed to get a start during the foggy days of May they will be hard indeed to control in June.

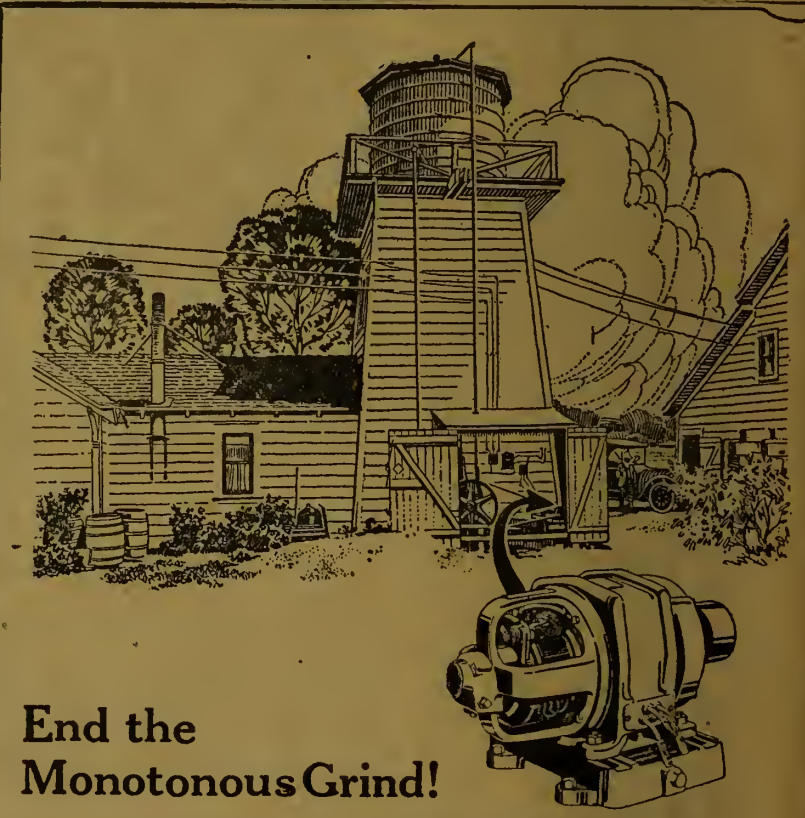
All coops, brooders and laying houses should be sprayed or painted with an insecticide during the spring. Go over roosts and adjacent walls and nest boxes, not once but three times a week apart. The second application gets the nits that have hatched since the first application, and the third finishes the job. Carbolineum, kerosene and crude carbolic acid, or even kerosene alone, will clean them out in three applications.

Coops in which the young stock are kept should be watched with special care. When the young birds stand around with drooping wings during the day it is amost certain they are suffering from the attacks of these blood sucking mites at night.

ALL NORTHWEST EGG LAYING CONTEST

Report of contest at Pullman, Washington, April, 1920.

The following gives the per cent production, feed cost and the return above feed cost for the average bird



End the Monotonous Grind!

G-E Motors Save Both Time and Labor!

FREE yourself from hard tasks by putting G-E motors on the farm.

A *one horse-power* G-E motor can do the work of six good farm "huskies"—no need of "fine figuring" to see the dollars saved when motors replace men!

General Electric Company

General Office Schenectady, N.Y.

Sales Offices in all large cities

45-87

in each breed for the month of April, 1920:

White Leghorns, 38.3 per cent production; feed cost, 21.6 cents; return above feed cost, 18.6 cents; R. I. Reds, 22.6 per cent production; feed cost, 24.6 cents; 1.2 cents loss; R. I. Whites, 37.3 per cent production; feed cost, 27.9 cents; return above feed cost, 11.2 cents; Barred Rocks, 42.6 per cent production; feed cost, 27.2 cents; return above feed cost, 17.5 cents; Wyandottes, 30.3 per cent production; feed cost, 22.8 cents; return above feed cost, 8.9 cents; Orpingtons, 27.6 per cent production; feed cost, 28.7 cents; return above feed cost, .2 cents; miscellaneous, 24.3 per cent production; feed cost, 19.3 per cent; return above feed cost, 6.2 cents.

High hen for the month is a Rhode Island White owned by F. W. Frederick, Cassidy, British Columbia, with 26 eggs. Mr. Frederick's pen of Rhode Island Whites is also high pen for the month with 103 eggs. Second high hen is a Rhode Island White owned by the White Bird Poultry Yards, Vancouver, British Columbia, with 25 eggs. Second high pen for the month is Barred Rocks owned by Oregon agricultural college, Corvallis, Oregon, with 97 eggs.

High hen to date is White Wyandotte owned by A. Unsworth, Sardis, British Columbia, with 145 eggs. Second high hen is Barred Rock owned by Oregon agricultural college, with 132 eggs.

High pen to date, Barred Rocks owned by Oregon agricultural college, with 537 eggs. Second high pen, White Leghorns, owned by W. A. Ford, Umatilla, Oregon, with a record of 511 eggs.

A number of entries have been received for the Fifth All Northwest Contest. The fifth contest will commence October 15, 1920, and close October 14, 1921.

VARIATION IN COLOR OF EGG SHELLS

By Mrs. J. H. Getz

I have just received my Cultivator, May 15, and as I am interested in poultry, one of the first things I do when I get the paper is to look for the poultry news. I notice on page 835 a query from a Galt subscriber on the color of eggs. I hope I can help our friend out of her trouble. There is no poultry breeder that knows it all, we must live and learn.

It is impossible to have a uniform shade in your eggs in even a small flock. Even the white eggs are not all pure white, but I believe the variation is far more noticeable in the brown eggs. For instance you trapnest a certain hen for a month or so Put all of her eggs in a drawer together and you will be surprised at the variation in shade. The eggs will at first perhaps be almost white. They will gradually become darker and darker and some will be very dark brown. Of course some hens will lay a reddish brown egg while others will lay a sort of a tan colored egg, but it is just like a leaf. The leaves of an orange tree are green but all are not the same shade. Some are light and some are dark. The leaf of an olive tree is green but an entirely different shade of green from an orange leaf. Then we find different shades in the olive leaves but each olive leaf though of a different shade combines while the orange leaf color on an olive tree would be entirely out of place with the ollve leaves. So it is in every kind of tree or vegetable. The color of the leaves or flowers or fruit shades. from light to dark. So it is with the hen's egg. There is no hen but what will lay a very light colored egg. She will again lay a very dark colored egg. Each batch of eggs she lays will usually begin with elther very dark or very light eggs and gradually change in shade. I have raised S. C. R. I. Reds and know it to be a fact.

I now ralse White Rocks and sometimes I will get a mixture in shades while other times I will get many light eggs even almost white at times and again they will most all be dark brown. I have trapnested and I know this to be a fact. Of course in trapnesting a large flock one will not notice this unless he pays partlcular attention to the gradual change in each hen's eggs.

Some people ask me the why of the difference in color and I tell them my belief of the why. The dark shelled eggs generally contain pullets and the white shelled eggs generally contain the cockerels. If our hatcheries did not reject so many of the dark shelled eggs of the White Leghorns they would hatch far more pullets. When I was raising White Leghorns I used to select my eggs in the daylight the day they were laid. I always rejected the pure white eggs and I had very few cockerels in my hatches. You must of course know your hen and know the kind of egg she is accustomed to lay as some Leghorns don't lay a pure white egg at any time and their eggs are not dependable. I would not supply any customer with all dark brown eggs at the same price as the medium or light eggs for the pullets are what I am mostly after as my hens are the bred to lay hens. If a certain customer wanted all of one shade I would not object to sell them to him provided he were willing to pay the difierence in price for the uniform shade. I would not want the uniform shade if I were buying a setting of eggs unless my object was all cockerels or all pullets.

AT THE A. P. A.

At the annual convention of the American Poultry Association the succèss of California cooperating poultry people will be told by Manager Barber of the Poultry Producers of Central California. Chairman Quisenberry of the convention committee writes, calling our attention to the convention which will be held in Kansas City, August 10 to 13. He refers to the prosperity of poultry people and to the many problems of vital interest, especially high priced feeds and difficulty in marketing, and the success which has been secured by California cooperators, Mr. Qulsenberry writes:

"J. H. Barber, manager of the California Poultry Producers Association, has been invited to explain the methods of cooperation which are used so successfully in California, and which are pushing the poultry industry In that state to the front and making it profitable for all producers."

and again adds:

"The Cooperative Poultry Associations as they are conducted in California and some of the Pacific Coast states have proven a remarkable success. They have put the poultry industry in those states on a sound financial basis and insured profits to the poultry producers. The manager and organizer and some of the members of these associations will be here to tell the American poultrymen how they are doing the work, and plans will be worked out for organizing similar associations in the various states of the Union.

"Some method of creating a national advertisIng fund to advertise the food value of poultry and eggs, to encourage their consumption and to show their qualities compared with other food products will be proposed at this great convention. It may be that we can work out some method whereby our poultrymen will be taxed two cents per hen on each farm, or some other method of raising a national fund for this purpose. This has been done by the orange growers, the raisin growers, the National Dairy Association, the National Apple Association, the National Peach Growers, and many other agricultural products are being pushed and advertised and markets created through an advertlsing fund of this nature. There is nothing that will come before the association that will mean so much to the industry and that will help to hold up the price of eggs and poultry as will an advertising campaign of this sort. This question will be discussed and some action taken to organize the whole nation with this object in view. This work alone is worth your trip to Kansas City to attend this national convention."

THE REAL TROUBLE

"The pulling down of the temple was the cause of Samson's remarkable feat."

"Remarkable feet? I should call it a case of fallen arches."

For Dependable Threshing with the Fordson

Get the utmost efficiency from your Fordson by belting it to an individual thresher and handling your own small grain crops. The more belt work your Fordson does, the greater will be the return on your tractor investment. With an individual outfit you plan your work—you thresh when it is most convenient to *you*.

But dependable threshing and satisfactory belt work with the Fordson tractor is best assured when you use the Little Giant tractor belt—the belt specially designed for use with this tractor.

The Little Giant belt is endless so there are no belt ends to pull out and no stops for relacing.

It has a powerful clinging pulley-grip that not only conquers slippage but also overcomes any tendency toward throwing the belt off when a bunch of wet bundles goes through the separator.

It is unusually serviceable and withstands to a marked degree the effects of exposure to moisture, heat and all the ordinary enemies to belt efficiency in farming.

It is made of four plies of a single piece of best quality, heavy canvas, pressed, stitched, with double stitches at the edges to withstand edge wear. Its special design compels it to run straight and true always. You can get Little Giant belts in three lengths—50 ft., 75 ft. and 100 ft. from your Fordson dealer.

Tomatoes: Imperial Valley Stock: Supplies liberal; market steady; per crate, best, 2.25@2.50; Mexican best, 7@10 per lb.

Turnips: Per dozen, 40@50; per sack, 2.00@2.25.

FRUITS

These are the actual prices obtained June 1, by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk.

Apricots: 12@14 lb.

Bananas, 10; Red, 10.

Blackberries: Supplies light; per crate, mostly 4.00@4.50.

Cherries: Black Knight and Black Tartarian, best, 14@16 per lb.

Gooseberries: lb., 10@12.

Cantaloupes: Imperial Valley: Standards, 7.00; ponies, 5.00@6.00; flats, 2.50

Carlots: Haulings moderate, slightly increasing. Track sales: mostly consigned, quality and condition generally good, size improving.

Loquats: Best, mostly 12@15; poorer low as 7 per lb.

Raspberries: cr., 4.00@4.75.

Strawberries: No arrivals. Local: Market firm. Per crate, 5.50@7.00; per tray, 2.75@3.50.

Grapefruit: per box, best, 4.00@4.50. Seedlings packed, 2.50@3.00; loose, 2.00@3.00.

Lemons: Market firm. Local stock: packed, 3.50@4.25; loose, 2.00@2.25; 2@3 per lb., juice, 2.00@3.00.

Oranges: No carlot arrivals. Supplies liberal. California Navels, best brands, packed, 80's to 100's, best, 4.00@4.75; 126's to 150's, best, 5.00@5.50. Local Market: packed, 80's, 3.50; 96's, 4.00; large sizes, low as 2.25; lugs, culls, mostly 1.50@1.75. Valencias: Packed, special brands, 5.00@5.50; local packed, 3.75@4.25.

HONEY

Demand exceeds supply, movement limited, market higher. Old honey practically exhausted, new supply not on market for about two weeks. Carloads f. o. b., usual terms. Light amber sags per pound, 18; light amber alfalfa, 17. Beeswax, l. c. l. lots, 40@42.

BEANS

California Lima Bean Growers Association:

Limas, 10.43 per cwt.; Baby Limas, 10.00 per cwt, f. o. b. coast.

HAY

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	24.00@26.00
Barley	18.00@20.00
Alfalfa	23.00@27.00
Barley Straw	8.00@10.00

Alfalfa Growers of California, under date of June 2, say:

Receipts of alfalfa hay this week again light and prices poor. Spot lots are still at the same level. The demand for future shipments is gradually broadening and we have made further sales of round lots. Shipments within 30 days have equalled $30 to $31 per ton delivered in Los Angeles. Growers do not sell freely at these prices unless compelled to do so, as it is hard for them, if not impossible, to make both ends meet on this basis, especially in view of prospective light yield for the season in many sections. Farmers may not be accused of profiteering at these prices.

Los Angeles prices as named this week:

Rabbit Alfalfa	38.00
No. 1 Dairy	33.00
Standard	30.00
Stock	28.00

GRAIN AND FEEDS

Price bid local grain exch. cwt., June 1.
Barley: Carlots, 3.17½@3.20.
Corn: Sacked Yellow, 3.85@3.91¼.
Milo: 3.00@3.20.
Wheat, mixed feed: Utah-Idaho, 6.00.

San Francisco Markets

San Francisco, June 1, 1920.

BUTTER

Quotations made daily by the San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

POULTRY

Wholesale prices are:

Leghorn, 30@31; large, 37@39; roosters, young, 45@50; old, 18@20; broilers, 29@35. fryers, 45@50; turkeys, live, 37@40; dressed, 48@50.

Ducks, Indian Runner, 23@25; Pekin, 28@30. Squabs, 55@60; pigeons, doz., 2.35@2.50.

Belgian hares, live, 22@25; Jack rabbits, dozen, 1.50@3.50.

LIVESTOCK

Cattle—Grass steers, No. 1, weighing 1,000 to 1,200 lbs., 9@10½; do, 1,200 to 1,400 lbs., 8½@9½; do, second quality, 7@9; thin, 6@7.

Cows and Heifers—No. 1, 7½@8; second quality, 6@7; common to thin, 3@4.

Calves—Light weight, 10@11; medium, 8@9; heavy, 7@8.

Lambs—Milk, 11@12; yearling, 9@9½.

Sheep—Wethers, 8@8½; ewes, 7@7½.

Hogs—Weighing 100 to 150 lbs, 15; 150 to 225 lbs., 16; 225 to 300 lbs., 15½; 300 to 400 lbs., 14½.

Virden Packing Company quotes prices on live stock, weighed and delivered off cars at their plant, South San Francisco, as follows:

Cattle: Good steers, 1000 to 1100 lbs., 10@10½; top steers, 1100 to 1200 lbs., 9@9½; good heifers, 1200 lbs. and over, market price; good cows and heifers, 7½@8; No. 2 cows and heifers, 6½@7; canner cows, 3½@4; good bulls, 4½@5.

Calves: Light, 13@14.

Hogs: Top packer, hard and well finished; 100 to 150 lbs, 15½; 150 to 225 lbs., 16½; 225 to 300 lbs., 15½; over 300 lbs., 15; under 100 lbs., 14.

Ewes: Full wool, 7@8.

Wethers: Full wool, 9½@10.

Yearlings: 10½@11.

Milk lambs: 60 to 70 lbs, 10@11; over 70 lbs., 9@10.

POTATOES

River, 7@8 per lb. Idaho Gems, .50@7.00 per 100 lbs.; new, 6@7 per lb.; new garnets, 6.00@7.00 per 100 lbs.; Turlock sweets, 10 per lb.

ONIONS

New Reds, 1.75@2.00; green onions, 1.50@1.75. Garlic, old, 30@35; new, 15@22½ lb.

VEGETABLES

Wholesale selling price:

Artichokes, 1.00@5.00.

Asparagus: lb., white, 6@10, graded, 10@12; gr, 4@7.

Beans: lb., string, 5@8; wax, 3@7.

Celery: cr., 3.00@3.75.

Cucumbers: Eng., doz., 1.50@1.75; hothouse, bx., 2.00@2.25.

Lettuce: L. A., 90@1.50 cr.

Peppers: Bells, 20@25 for large, 10@13 for small; chili, 12½@25.

Peas: lb., green, 3½@4½.

Radish, 7@9 doz. bunches.

Rhubarb: bx., 1.25@2.00.

Spinach: lb., 6.

Squash: Summer, cr., 1.25@1.65.

Tomatoes: Brawley, cr., 2.00@3.25.

DECIDUOUS FRUITS

Apricots: Imperial Valley, Los Angeles lugs, 10@15 per lb.; 2.50@3.50 per crate.

Bananas: lb., 7@9½.

Cantaloupes: Ponies, 4.00@6.00; flats, 2.00@3.00; standards, 6.50@8.00.

Cherries: Purple Guigne, 1.75@2.25 and drawers; loose, whites, 7@12; blacks, 10@15 lb., according to quality.

Figs: 1.00@1.25 for white and Brunswick per box of one layer.

Gooseberries: lb., 7@9½.

Loquats: lb., 6@15.

Pineapples: Doz., 3.00@5.00.

Raspberries: dr., 1.50@1.75.

Strawberries: Peninsula, dr., large, 75@1.00; small, 45@70.

Watermelons: Imperial Valley, lb., 12½.

CITRUS

Box:Lemons, standards, 2.50@3.00; lemonettes, fancy, 2.75@3.00; choice, 1.50@2.00; grapefruit, fancy, 2.50@3.50; choice, 1.75@2.25; limes, 4.00@4.50 crate.

Box: Lemons, standards, 2.50@3.00; lemonettes, fancy, 1.00@1.50; grapefruit, fancy, 2.50@3.00; choice, 2.00@2.50; oranges, navel, 3.00@6.50; limes, 4.00@4.50 crate; tangerines, 1.50@3.25 crate.

DRIED FRUITS

Prunes:

Prune prices announced by the California Prune and Apricot Growers, Inc., were for the base prices, according to sizes, and are: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11½c; 70-80s, 11c; 80-90s, 11c; 90-100s, 11c. One cent a pound premium will be paid on fruit delivered before September 20. On small-sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.

Peaches:

Peach prices announced by the California Peach Growers, Inc., for 1919 crop dried peaches for the domestic and foreign trade; September, October, November shipment, seller's option; guaranteed against our own decline until January 1, 1920, are as follows:

Standard yellows, 14¾c; Muirs, 15c.
Choice yellows, 15½c; Muirs, 15½c.
Fancy yellows, 16½c; Muirs, 17½c.
Extra fancy yellows, 17¾c; Muirs, 18¾c.
Slabs, yellows, 14½c.

For "practically peeled" add 1½c per pound (any grade).

Prices above are all bulk basis.

For packing in 50 pound or 25 kilo boxes add 1 cent per pound.

25 pound or 12½ kllo boxes, all 1¼c per pound.

10 pound boxes, add 2c per pound.

Blue ribbon peaches packed 2 pound cartons, 12 per case, $10 per case.

Blue ribbon peaches packed 2 pound cartons, 24 per case, $10 per case.

Bakers' special "practically peeled," 16¾c per pound, bulk basis.

Apples:

Choice (in 50s), 20@20½; extra choice (in 50s), 21@21½; fancy (in 50s), 23@23½.

Figs:

White: Cooking (in 50s), 15@16; choice (in 50s), 17@18; extra choice (in 50s), 19@20; fancy (in 50s), 21@22; extra fancy (in 50s), 23@24; bricks, 12 No. 10s, 1.60@1.67½; bricks, 24 No. 8s, 2.55@2.65; bricks, 50 No. 6s, 4.00@4.15; bricks, 70 No. 4s, 4.20@4.25; layers, No. 10, 2.50@2.80. Calimyrna: Cooking (in 50s), 19; choice (in 50s), 23; extra choice (in 50s), 24; fancy (in 50s), 26; extra fancy (in 50s), 27½; bricks, 10 1-lb., 2.75; layers, No. 10, 2.95@3.20. Black: Standard 14, choice 17@18; extra choice, 18@19; fancy, 19@20.

Pears:

Standard 20, choice, 22½; extra choice, 24; fancy, 26@27.

WALNUTS

Net prices have been named by California Walnut Growers' Association.

No. 1, 31½.
No. 2, 26.
Diamond Brand Buds, 34.
Golden State Buds, 34.
1918 No. 1 price was 28; fancy budded, 31½.

BEANS AND PEAS

California Bean Growers Association, San Francisco:

The bean market has shown considerable activity during the past two weeks, particularly for California Large and Small Whites and Pinks. For the past few days, however, owing to car shortage and railroad strike conditions which are still an important factor in the East, there has been a slight easing up in orders on account of the difficulty in securing transportation. The market is firm, with an upward tendency, the following prices being quoted at this date:

Large Whites	6.50@6.70
Small Whites	6.10@6.35
Mexican Reds	9.40@9.50
Red Kidneys	14.00@14.50
Bayos	10.40@10.60
Pinks	6.60@6.80
Cranberries	6.50@6.75

Prices reported in daily papers:

Jobbing prices at San Francisco, per cental: Small white, 6.20@6.30; large white, Bayo, 9.50@9.75; blackeye, 8.40@8.50; red, 6.60@6.70; cranberry, 6.25@6.50; red Mexican, 9.00@9.25; pink, 6.60@6.70; California kidney, 13.00@13.15; lima, 10.90@11.00; Garvanza, 9.00@9.50.

Dried Peas: California, 5.00@5.25 cental.

Lentils: California, 11@11½ per lb.; Chile, 12 per lb.

HOPS

1919 crop, 1.00@1.05 per lb. Prices to growers for 1920 crop, 75@80 per lb.

HONEY

Old crop is scarce and hard to quote. New white orange extracted is 21, f. o. b.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.58
No. 3	2.00	3.48 1-3

The above are minimum prices.

For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.40@3.50.

Corn: California yellow, 3.70@3.75 per cental; Egyptian white, 4.10@4.25; California milo maize, 3.45@3.50; Eastern milo maize, 3.15@3.25.

Barley: No. 1 feed, 3.40@3.50.

HAY

Under date of May 29, Scott-Magner, Miller, say:

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Fancy wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat and Wheat and Oat hay	35.00@38.00
No. 2 Wheat and Wheat and Oat hay	32.00@35.00
Choice Tame Oat hay	37.00@40.00
Wild Oat hay	Nominal
Other Tame Oat hay	33.00@37.00
Barley hay	Nominal
Alfalfa hay new	25.00@30.00
Alfalfa hay, old	30.00@32.00
Stock hay	29.00@32.00
Oregon Cheat and Oat hay	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, California, June 2, 1920.

Delayed freights have resulted in serious decay. Some stuff has been sold at desperately low prices. Good stock is still commanding good prices. Valencias are now going forward rapidly. It is estimated that there are approximately 9,000 cars to be shipped before December 1. This is materially lower than last year's output which aggregated 15,457 between June 1 and December 1.

The demand for California lemons is only fair; buyers are waiting for a period of warm weather. Shipments going forward very light. The number of cars of lemons will greatly increase in a few days in order to throw a big bunch of stuff in Eastern markets for Fourth of July trade.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919. Oranges, 20,078 cars; lemons, 4,373; total, 24,451. To same date last season: Oranges, 23,124; lemons, 2,795; total, 28,919. From Central California, to date this season: Oranges, 5,315; lemons, 288; total, 5,603. To same date last season: Oranges, 3,366; lemons, 251; total, 3,617. Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

YIELDS INCREASED BY USING STRAW

According to experiments made at the West Central Station, Minnesota, farmers who burn their straw or allow the stacks to stand for years in the fields are robbing themselves. Applying straw directly to the land has given good results.

Results of experiments conducted the last four years: For a four year average, one ton of wheat straw plowed under each year gave an increase of 6.2 bushels of corn to the acre the following year, while one ton of corn stover plowed under gave an average increase of 1.5 bushels of wheat each year during the same period.

Heavier applications gave smaller increases. Two tons of wheat straw gave an average gain of only 3.3 bushels of corn, while two tons of corn stover gave an average gain of only 0.4 bushels of wheat, compared with the untreated land.

This experiment was begun in 1916 and during the first two years there were no increases with wheat, but during the next two years wheat gave an increase each year with both the one ton and two ton stover applications. In 1916 there was no increase with corn, but in 1917 there was a very decided increase, and in both 1918 and 1919 there was a very decided increase from the one ton applications. It seems apparent that the cumulative effect, especially with an application of one ton, is having beneficial influence upon yields.

We are coming to the conclusion that straw in amounts of one ton per acre can be applied with benefit upon land which is to be used for corn or wheat. The results at this station seem to indicate that it will take at least two applications before noticeable increases in yield are obtained. Inasmuch as only a small part of the straw can be handled as litter, it would appear that spreading it directly upon the land is an easy and effective way of making use of it.

YES—FEED THE FISHWORMS!

You don't find many fishworms in a sand bank. There is nothing there for them to eat. Nor will you find many in a light, sandy soil. There is not much more to eat there than in the sand bank.

If you will put a thick layer of leaves on sandy soil and place a few fishworms on the leaves something is likely to happen. The worms will make their way through the leaves to the top of the soil. Then they will begin to eat the leaves and draw them down into the holes in the soil that the earthworms are always making. The small bits of leaves along with the small bits of soil pass through the bodies of the worms and are finally cast out as little pellets on the surface beside the holes. You can see such little piles of pellets almost any summer morning by looking in the garden.

This experiment shows what is happening all summer in every garden where leaves and fishworms are present. And it is not leaves alone that the fishworms eat. All kinds of plant materials soft enough for them to get hold of are devoured and the particles passed through their bodies to be cast out as pellets on the surface. In this way the earthworms have been very helpful in increasing the depth of soils. For while one worm alone may not do much in one year, a million worms in a hundred years will accomplish a great deal.

You will readily see that this grinding up of the leaves in the bodies of the worms makes them more useful in furnishing food to roots of plants. The tiny root hairs can penetrate all through the fine particles and absorb moisture and food. But the grinding up is also helpful in another way. The soil is full of minute germs called bacteria, which are always at work, producing food for plant growth. These bacteria can work much better in this finely ground leafy material than in coarse leaves. So the worms are of great assistance in making the soil richer in chemicals for plant growth.

Even the holes that the worms make in the soil are helpful. They permit air to penetrate and rain to run in, thus furnishing two of the most necessary things to keep the soil in action. On this account alone it is desirable to have earth worms in the garden.

Humus is called the food producer. When you feed fallen leaves to the fish worms they become producers of humus and enrich the soil by so doing. They help to make the soil better, but they must have plant materials to do it with. In general the richer your garden the more earthworms there will be.

So it all comes down to this: If you feed the fishworms the fishworms will feed you.

REDUCED ACREAGES IN POTATOES AND BEANS INDICATED

Reductions of five per cent in the acreage planted to potatoes last year and of 29 per cent in areas devoted to beans are indicated for this season in reports just received by the bureau of crop estimates, United States department of agriculture. The reports came through the field agents of the bureau who on May 1 inquired of growers in important producing states concerning their intended plantings. High prices for potato seed and the farm labor shortage are the principal reasons given for the reduction in potato plantings. The unsatisfactory market for beans is given as the reason for the smaller acreage planned for that crop. The reports show that for the states covered the potato acreage will be 95 per cent as large as last year, while the bean acreage will be 71 per cent of last year.

New York reports the intention to plant 97 per cent of last year's acreage in potatoes, Michigan 90, Wisconsin 95, Minnesota 89, Colorado 94, Idaho 95, and California 110. Aroostook County, Maine, which produces 60 per cent of the potato crop of New England, intended to plant as much or more, but deep snows, strikes and embargoes have delayed receipt of fertilizer, and plantings will depend upon the amount received in time.

THE HONEY LOCUST

The honey locust tree, Gleditschia triacanthos, is planted in every state, for it is native to the southern part of the United States. It is a common tree in California, but more popular in the central and northern counties where deciduous trees are more in demand than in the southern part. It is a hardy, long lived drouth resistant tree that will grow 40 or 50 feet high and three to four feet in diameter of trunk, and in favorable soils makes rapid growth, though growing in any.

Aside from its use in this country the honey locust has been very generally planted and appreciated abroad. The Australians have been loud in its praises for a variety of uses, using it for fence posts and fuel and the lumber for flooring where resistance to dampness is needed. It is also much used there and elsewhere, notably in Port Said and other Egyptian cities, for street planting, reveling in hot, dry, alkaline regions. In fact it seems to be best appreciated away from home. It bears heavy crops of beans that make excellent food for hogs, eaten at any stage, though generally allowed to drop from the trees at maturity. As a hedge to turn stock it has few equals, being armed with formidable spines or thorns two to four inches long. The tree may safely be pruned in winter to any size or shape, even to a low hedge, without in the least impairing its vigor. It would seem, from having so many good points, that it should be more extensively planted in California, especially in stock raising sections.—E. B.

DUST FANS FOR GRAIN THRESHERS

The frequency of dust explosions and fires in connection with threshing operations in the wheat producing section of the Pacific Northwest has led to the development of a dust collecting fan, a device designed and perfected by engineers of the United States department of agriculture in cooperation with the manufacturers of threshing machinery. This apparatus has proved so successful that many grain separators in the Pacific Northwest are now equipped with the device.

This device, when used in conjunction with a wiring system to carry off charges of static electricity developed by the thresher, and further aided by a fire extinguisher adapted to separators, gives the thresher a protection nearly absolute. Eventually this protection will greatly lessen the insurance risk, which hitherto has been at the prohibitive rate of $80 to $100 for each $1,000 of property insured. And this rate is only for a 20 day run.

Now it appears that the joint project of the bureaus of chemistry, plant industry and markets is to produce specific results in protection from fire and explosion and a decrease in insurance rates; the cleaning of grain, particularly of smut; and the checking of wheat smut through the collection of the smut spores by the fans at the time of threshing. This method reduces the wind dissemination of spores which otherwise would be blown out of the wind stacker to infest the fields.

San Joaquin Valley Orchard Scene

COULDN'T KEEP QUIET

He was driving a four mule team hitched to a ration wagon, and he lost his way in the night and mist and drove right through the American trench line, which was not continuous at that point, and started rumbling along an old road which led across No Man's Land. He had gone a few rods when a doughboy jumped out of a listening post and began to signal to him with both hands.

"What's the matter?" shouted the driver.

"Hush!" said the doughboy in a low and agonized whisper. "You're headed straight toward the German lines. For God's sake, turn around and don't speak above a whisper."

"Whisper, hell!" boomed the driver. "I've got to turn four mules around.—New York Tribune.

Poisoning and Trapping Rats and Mice

One of the cheapest and most effective poisons for rats and mice is barium carbonate. This mineral has the advantage of being without taste or smell. It has a corrosive action on the mucous lining of the stomach and is dangerous to larger animals if taken in sufficient quantity. In small doses fed to rats it would be harmless to domestic animals. Its action upon rats is slow, and if exit is possible the animals usually leave the premises in search of water. For this reason the poison may frequentiy, through not always, be used in houses without disagreeable consequences.

Barium Carbonate

Barium carbonate may be fed in the form of dough composed of four parts of meal or flour and one part of the mineral. A more convenient bait is ordinary oatmeal with about one-eighth of its bulk of the mineral, mixed with water into a stiff dough. A third plan is to spread the barium carbonate upon fish, toasted bread (moistened), or ordinary bread and butter. The prepared bait should be placed in rat or mice runs, about a teaspoonful at a place. If a single application of the poison faiis to kiil or drive away all rats or mice from the premises, it should be repeated with a change of bait.

Strychnine Sulphate

Strychnine sulphate is too rapid in action to make its use for rats or mice desirable in houses, but elsewhere it may be employed effectively. Strychnine sulphate is the best form to use. The dry crystals may be inserted in small pieces of raw meat, sausage or toasted cheese, and these placed in rat or mice runs or burrows; or oatmeal may be moistened with strychnine syrup and small quantities laid in the same way.

Strychnine syrup is prepared as follows: Dissolve a half ounce of strychnine sulphate in a pint of boiling water; add a pint of thick sugar syrup and stir thoroughly. A smaller quantity may be prepared with proportional quantity of water and syrup. In preparing the bait it is necessary to moisten all the oatmeal with the syrup. Wheat and corn are excellent alternative baits. The grain should be soaked over night in the strychnine syrup.

Arsenic

Arsenic is probably the most popular of the rat poisons, owing to its cheapness, yet experiments prove that, measured by results obtained, arsenic is dearer than strychnine. Besides, arsenic is extremely variable in its effect upon rats, and if the animals survive a first dose it is very difficult to induce them to take another.

Powdered White Arsenic

Powdered white arsenic (arsenous acid) may be fed to rats and mice in almost any of the baits mentioned under barium carbonate and strychnine. It has been used successfully when rubbed into fresh fish or spread on buttered toast. Another method is to mix 12 parts by weight of corn meal and one part of arsenic with whites of eggs into a stiff dough.

An old formula for poisoning rats and mice with arsenic is the following: Take a pound of oatmeal, a pound of coarse brown sugar, and a spoonful of arsenic. Mix well together and put the composition into an earthen jar. Put a tablespoonful at a place in runs frequented by rats and mice.

Poison in Poultry Houses

For poisoning rats in buildings and yards occupied by poultry the following method is recommended: Two wooden boxes should be used, one considerably larger than the other and each having one or more holes in the sides large enough to admit rats. The poison bait should be placed on the bottom and near the middle of the smaller box, and the larger box should then be inverted over it. Rats thus have free access to the bait, but fowls are excluded.

Trapping

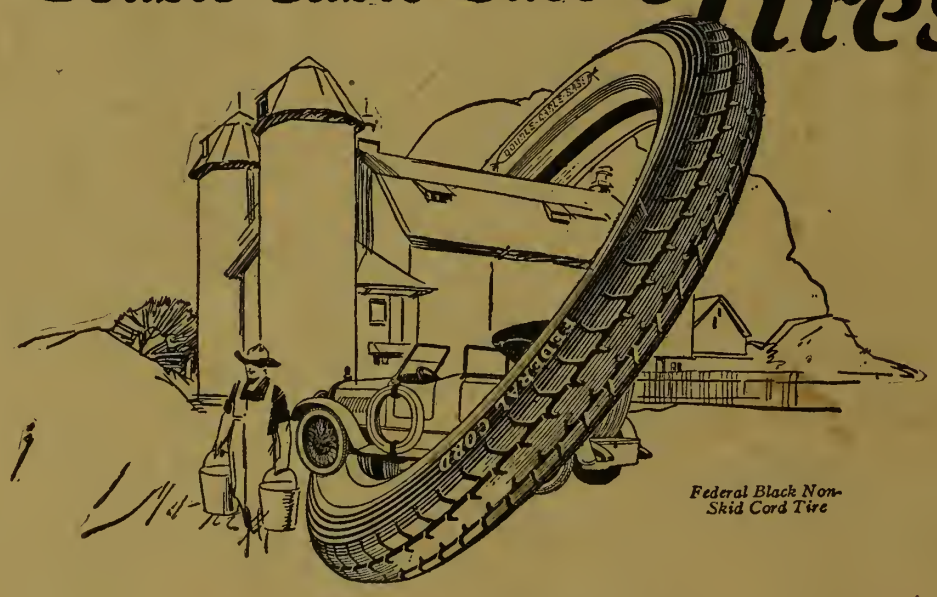
Owing to their cunning it is not always easy to clear rats from premises by trapping; if food is abundant it is impossible. A few adults refuse to enter the most innocent looking trap. And yet trapping, if persistently followed, is one of the most effective ways of destroying the animals.

For general use the improved modern traps with a wire fall released by a baited trigger and driven by a coiled spring have marked advantages over the old forms, and many of them may be used at the same time. These traps, sometimes called "guillotine" traps, are of many designs, but the more simply constructed are preferable. Probably those made entirely of metal are best, as they are more durable. Guillotine traps should be baited with small pieces of sausage or fried bacon. Other excellent baits for rats are oatmeal, toasted cheese, toasted bread (buttered), fish, fish offal, fresh liver, raw meat, pine nuts, apples, carrots, corn, and sunflower, squash or pumpkin seeds. Broken fresh eggs are good bait at all seasons, and ripe tomatoes, green cucumbers and other fresh vegetables are very tempting to the animals in the winter.

When rats are abundant, the large French wire cage traps may be used to advantage. They should be made of stiff wire, well reinforced. Cage traps may be baited and left open for several nights until the rats are accustomed to enter them to obtain food. They should then be closed and freshly baited, when a larger catch may be expected, especially of young rats. It is better to cover the trap than to leave it exposed. A short board should be laid on the trap and an old cloth or bag or bunch of hay or straw thrown carelessly over the top. If a single rat is caught it may be left in the trap as a decoy to others.

FEDERAL

Double Cable Base Tires



Federal Black Non-Skid Cord Tire

Tire and Wheel Are One

When you use Federal Tires, your power drives *the car*—it doesn't run a grist mill, of *wheel-rims against tires*.

Federal Tires are grappled inseparably to the rims by four steel cables—the Double-Cable-Base—exclusive to Federal Tires.

This is why Federal Tires do not come off, slip, slide or creep, rim-cut or blow out just above the rim.

Avoid rim-troubles—get the mileage that thousands of other Federal users are getting. Go to the Federal dealer and equip with Federals.

FINLAND PINE TAR

The methods pursued in the past for obtaining tar in Finland have been very destructive to her pine forests and better methods are gradually being adopted. Fortunately, perhaps, since 1863, the boom year of the pine tar industry, iron and steel have largely taken the place of wooden ships and tar is in less demand than in former years.

The following primitive method of getting tar, which fortunately is being done away with, was used extensively. The bark is stripped off each pine tree to a height of seven or eight feet, a narrow strip being left on the north side, where the bark is strongest, in order to preserve the life of the tree. This stripping goes on for three or four years, or as long as the tree will stand it, each time a little higher, and a thick yellow resin oozes out of the peeled wood and forms a thick crust on the trunk. With the last treatment the narrow strip of bark that has been left on to preserve the tree is also removed, and when the snow is on the ground those trees which have had their final treatment are felled and carried on sledges to the tar kilns, which are huge, saucer shaped affairs constructed of wooden logs bricked over and cemented, and are usually built along the river banks.

The tree trunks are cut into pieces of about a yard in length and piled upon the kiln, then covered with turf and kindled at several points. The kiln smolders for a couple of weeks, the resin crusts of the trunks gradually melting and the tar flowing down the kiln to the hole in the center, with which pipes are connected that conduct the tar into barrels. Most of the kilns are large enough to yield more than 100 barrels, or 40,000 pounds, of tar at one burning. If the kilns are not situated near any waterway, the tar is transported to the rivers by fixing the barrels to axles held together by beams of wood, so that the barrels themselves act as wheels, and in this way the horses can pull them over the rough roads very easily.

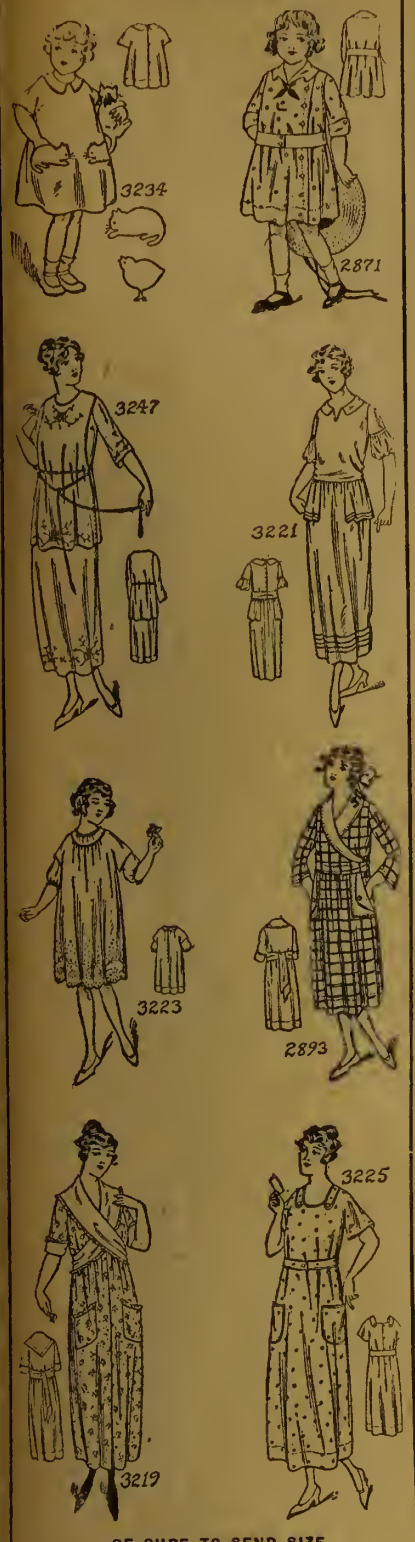
COTTON GOING AND COMING

Outgoing cotton bales please keep to the right. During March of the present year we exported 794,460 bales. We imported foreign cotton to the extent of 133,727 bales. And that is the program throughout the year, for in the eight months ending with March 1920, we imported 566,000 bales and exported 5,234,000 bales. During the same period we consumed 4,255,500 bales, exclusive of what was on hand in consuming estabiishments as storage, amounting to about 2,000,000 bales.

TESTING DANISH SEEDS

Near Copenhagen, Denmark, is the oldest and largest seed testing station in the world, and it is said "there is no country in the world where such care is exercised in the control of the seed used by the farmer, and this attention has been largely instrumental in the success of seed culture in Denmark."

The Cultivator Patterns



BE SURE TO SEND SIZE

3234. A New Play Apron. Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 1½ yards of 36 inch material. Price, 10 cents.

3247. A Charming Gown. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 4⅜ yards of 36 inch material for the dress, and 1⅞ yards for the jumper or over-blouse. The width of the skirt at lower edge is 1¾ yards. Price, 10 cents.

3223. Girls' Dress. Cut in 4 sizes: 4, 6, 8, and 10 years. A 6 year size will require 2 yards of 27 inch material for the guimpe, and 2½ yards for the over dress. Price, 10 cents.

3219. Lounging Robe. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size will require 7¼ yards of 36 inch material. The width of the skirt at its lower edge is 2 yards. Price, 10 cents.

2871. A Simple Dress. Cut in 4 sizes: 3, 4, 6 and 8 years. Size 4 requires 2½ yards of 36 inch material. Price, 10 cents.

3221. Misses' Dress. Cut in 3 sizes: 16, 18 and 20 years. For an 18 year size, 4¾ yards of 38 inch material will be required. Width of skirt at lower edge is about 1⅝ yards. Price, 10 cents.

2893. Girl's Dress. Cut in 3 sizes: 12, 14 and 16 years. Size 14 requires 4½ yards of 36 inch material. Price, 10 cents.

3225. Ladies' Apron. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; Extra Large, 44-46 inches bust measure. A Medium size will require 4 yards of 36 inch material. Price, 10 cents.

PRECEDENT

By Sam Walter Foss

(These verses have been printed in the Cultivator before, perhaps more than once, but are now reprinted by request.)

One day through the primeval wood
A calf walked home as good calves should,
But made a trail, all bent askew,
A crooked trail, as all calves do.
Since then three hundred years have fled,
And I infer the calf is dead.
But still he left behind his trail,
And thereby hangs my moral tale.

The trail was taken up next day
By a lone dog that passed that way,
And then a wise bell wether sheep
Pursued the trail o'er vale and steep,
And drew the flock behind him, too,
As good bell wethers always do.
And from that day, o'er hill and glade,
Through those old woods a path was made.

And many men wound in and out,
And dodged and turned and bent about,
And uttered words of righteous wrath
Because 'twas such a crooked path;
But still they followed—do not laugh—
The first migrations of that calf,
And through the winding wood way stalked
Because he wobbled when he walked.

This forest path became a lane
That bent and turned and turned again;
This crooked lane became a road,
Where many a poor horse with his load
Tolled on beneath the burning sun,
And traveled some three miles in one.
And thus a century and a half
They trod the footsteps of that calf.

The years passed on in swiftness fleet.
The road became a village street;
And this, before men were aware,
A city's crowded thoroughfare.
And soon the central street was this
Of a renowned metropolis!
And men two centuries and a half
Trod in the footsteps of that calf.

Each day a hundred thousand rout
Followed the zizag calf about,
And o'er his crooked journey went
The traffic of a continent.
A hundred thousand men were led
By one calf near three centuries dead.
They followed still his crooked way,
And lost one hundred years a day;
For thus such reverence is lent
To well established precedent.

A moral lesson this might teach
Were I ordained and called to preach;
For men are prone to go it blind
Along the calf paths of the mind,
And work away from sun to sun
To do what other men have done.
They follow in the beaten track,
And out and in, and forth and back,
And still their devious course pursue
To keep the path that others do.

NANCY'S EXPERIMENT

By Marjorie Sawyer, in Farmer's Wife

NANCY HENDRICKS, banker's daughter, stood at the front of the hayload, cheeks flushed and eyes shining. Her hands proudly guided the straining team as they marched up the ascent to the barn, clattered across the bridge and drew up triumphantly next to the haymow. Then she turned to her friends with head thrown back and arms outflung.

"I think the farm is the nicest place in the whole world!" she announced.

"That's because you don't have to live on it," commented Sally, sourly. Sally, by sheer perversity of nature, wanted to be a stenographer in a city office, and instead, here she was keeping house for her brother, who, nevertheless, was very dear to her.

Tom, however, gazed at Nancy with his heart in his eyes. In the dim barn a shaft of light came sliding down through a knot hole, filled with golden dust fairies, which came and rested on her wavy hair, turning it to gold too. Outside, a group of oaks left dark shadows on the golden landscape. Here was peace—not stagnant, but a live, glowing, active peace!

Nancy answered the look in Tom's eyes. "Isn't it wonderful?" she breathed.

Sally slid down the hay load with a grimace and went outside to see to the pulley rope. Then Tom jumped down too, and reached out his brown arms to his golden haired divinity, who descended demurely from her throne but could not evade his grasp.

"Would you be satisfied," he whispered, "to live on the farm here with me?"

Nancy looked all around the place as if cogitating, but dimpled at the little shake he gave her, and brought her gaze back to his eyes.

"I'd just—love—it," she answered.

A few minutes later Sally's footsteps resounded hollowly over the barn floor.

"Say," she called, "when are you people going to get that team out here?"

And Tom and Nancy came back to earth.

It was evening, after a long walk and talk together in the maple lane, when they broached the subject to Sally. She was sitting on the porch, gazing at the moonlight which made shadow lace on the carpet of grass before her. There was something restless, as of unsatisfied longing, about Sally, and tonight, as they approached, there was something wistful, too, Tom thought.

Then they broke the news. "And it's going to happen quite, quite soon, Sally dear," said Nancy, laying her head on her friend's knee a moment, "and you can make plans for your old commercial course right away."

"Do you really think you can manage the work, Nancy?" asked her friend, slowly.

"The work!" cried Nancy. "Why, dear girl, there's work anywhere and everywhere! I am young and strong, and why shouldn't I do it? How could I help but succeed with Tom here?"

"But—your folks—" continued Sally.

"I'm going down to see them right away, and I know they won't object. They never have refused me anything yet," she added, bubbling with laughter.

Sally only sighed and shook her head. But Tom and Nancy were undaunted, and she went home with high courage.

He waited a long time for her letter, however; but at last, after weeks, it seemed, he held it in his hand—his first love letter. His tanned face glowed with happiness as he read her simple words. But a page farther he commenced to frown.

"I can't understand the folks," he read; "they don't see it my way at all. Father and mother both say I know nothing whatever about the farm but its romantic side, and that the work would be too hard for me. 'n'everything. They say I can't cook—which is only too true, I'm afraid, boy dear—and that I simply don't know what I'm up against. But I don't care, Tom; I would do anything—" and here Tom was able to smile a little once more.

Thinking it over afterwards, however, he was chilled by the finality that seemed back of it all. So he decided to go and see her father about it at once.

That evening the train set him down in her city, and Tom walked boldly up the unfamiliar walk and rang her doorbell—or, more properly, her father's. And the next minutes he held a surprised but ecstatic Nancy in his arms.

"Tom! How did you happen to come?" she wispered.

"I came to see your father," he announced.

"My father?" she asked, her eyes widening in surprise.

"Yes," he said grimly; "where is he? Lead me to him." His voice was hard.

"Now?" asked Nancy, very doubtfully.

"Right away," he affirmed.

The next minute he was standing before a plump, bald headed man, with Nancy left firmly in the rear.

"My name's Tom Sherman," he said, with a little ring in his voice.

And then a long, earnest conference followed.

"I can't see it that way, my boy," said the banker, tapping his glasses on the polished table. "We have to look out for her happiness, and she was not brought up to be a farmer's wife. We have no objections to you, though—none at all. If you would go into some other business, now—" His eyes swept over the six feet of lean manhood, taking in the firm jaws and clear eyes—"a position in the bank now—perhaps I could manage that for you?"

The young man's eyes narrowed. He could see in vision the bank clerk's cage, and as that picture faded, dim purple hills rose before him, and golden fields, splashing brooks and soft eyed cattle. And there amid the fields was joy—freedom, independence. He turned to the older man.

"I'm sorry, sir," he said quietly, "but I can't give up my work.' And he turned and left the room.

"It's all coming out right, Nancy, dear," he said later, pressing her tear stained face to his shoulder, "but it all

Harvest Time
The Auto-Wheel Coaster
That's a time when you have more work than you can do. It seems that no matter how fast you work there is always more to be done. But the
Auto-Wheel Coaster
will help speed up the work for you. It saves you hundreds of trips. The roller-bearings enable you to haul a heavy load with ease—even a 1,000-pound load requires little effort to move.
And when the work is over you have a dandy wagon for play. You can coast—hitch the dogs to the coaster wagon—and have races with your pals.
The Auto-Wheel Coaster is easy to steer. It turns a corner with the ease of an automobile. It's well made, too. Seasoned ash and the best iron and steel. It will last you for years.
Send for our new magazine for boys. Full of news about our prize contests—and the prizes are just the things fellows like you want. We'll send you a copy of the magazine if you'll send us the names of three coaster dealers, mentioning which handles the wagon with the name "Auto-Wheel" on the sides. Send today for this magazine.

DAISY FLY KILLER
PLACED ANYWHERE ATTRACTS AND KILLS ALL FLIES. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 5 by EXPRESS, prepaid, $1.25.
HAROLD SOMERS, 160 De Kalb Ave., Brooklyn, N. Y.

depends on you.' He held her at arm's length and looked her straight in the eye. "Are you a sticker, or not?" he questioned. "Remember, all the world loves a sticker."

She laughed once more and shook her yellow head. "Your courage is—superb," she flashed at him.

"And so is my faith in you," he murmured.

But after he had gone home, that faith began to ebb slowly. Her letters were growing cold, it seemed. Was the pressure getting too strong for her? Was she losing faith in herself? Or was he too far away? Yes, that must be it!

Later on he wrote that he was coming Sunday. Soon after he got a telegram:

"Don't come now. Explanation follows."

"She isn't playing fair," said Sally, fiercely, as she peered over his shoulder.

"Hush, Sally! She must have some good reason," he responded.

A letter came, but no promised explanation. "I couldn't see you just now," it said. And Tom was sick at heart.

But he kept on bravely, writing often in spite of Sally's remonstrances. Gay, gentle letters—letters full of the spice of summer apples and the gold of harvest fields and wayside blossoms. But the answers came fewer and fewer. And at last one came which shattered his hope into bits and his faith, too.

"I am going away," it said. "It is useless to try to write me, or to find me."

"It just isn't fair," sobbed Sally, her arms around her brother's neck. "It just isn't fair!"

"She may have her own reasons, Sally," he repeated patiently.

"I wouldn't stand it," burst out Sally, indignantly. "She means she's jilted you, but wasn't man enough to come out and say so."

"Love doesn't work that way, Sally," was his sober answer.

"And her father wanted you to give up the farm! Give up our father's farm that he got with his own work!"

"Why, Sally! I didn't know you cared so much for the farm!"

Her hands clasped and unclasped. "Yes—I—care," she said.

No answer to his next letter, nor the next.

Then one day came a postal—a stingy postal card: "I am staying with one of father's friends," she wrote. "I am near Mansfield, but don't try to write to me."

And Tom waited again. Why did she write at all? Did she care for him a particle? Was she trying to test his love for her, or, maybe, hers for him? What was it?

At last, late in October, came a letter, a thick one, and in it one cherished sentence: "If you really care for me, Tom, enough to marry a hired girl, perhaps you had better meet me next Thursday in B."

It didn't take Tom long to go; no, indeed. And quicker, it seemed, than it takes to tell it, and yet very slowly, the time came when he was sitting opposite her at a little flower decked table.

"Not now," she said, when he asked for her explanation; "not until after lunch."

When they had finished he leaned forward expectantly. She toyed a glass with agitated fingers.

"Well, Nancy," he ventured.

"Well, Tom—I've been working on a farm." She announced it breathlessly, her cheeks crimson.

"You've—what?" he blinked.

She laughed then, to watch the amazement in his face.

"I've been working on a farm, Tom; as a hired girl."

He imprisoned her hands swiftly. "Tell me about it," he commanded, the old look in his eyes.

"Well, you see—" She took a long breath and started again.

"You see father and mother didn't believe my going onto a farm was anything more than a mad impulse. And they said I couldn't stand it. I didn't know what any housework was, much less farm work. And I would be lonesome and homesick. I said I would," she added with shy coquetry, "if I were away from you. No, stop! And at last I said I would try farm work for myself and see how it was. And finally they agreed."

Tom made an inarticulate answer.

"Father knew some people in the country," she continued. "They were good, respectable young people, he said, and if I were bound to work out it would be a good place. Meantime I must stop writing to you." At the hurt look in his eyes she said slowly, "That was hard on me too, Tom." Then, continuing, "In the house there were Mrs. Sanders and her husband, and his brother, and the baby. And I swept and made biscuits and washed the separator and scrubbed the back steps, and it wasn't hard. It wasn't harder than at home—just different, that's all. Then Mrs. Sanders got sick." There was a pause.

"What did you do then?" asked Tom, in a curiously strained voice.

"Everything," she dimpled. "All I had done before, and more too. Mrs. Sanders had a fever, and I had to carry a drink to her every two minutes. And then the baby would cry. I didn't do much housekeeping during that time. If it hadn't been for Mrs. Sanders' brother I don't know what I would have done—he was so kind! What did you say?"

"Nothing," growled Tom.

"And when Mrs. Sanders got a little better the threshers were there. So altogether I thought I had a real taste of farm life, Tom, and I love it! That is—I'd love it under some conditions, Tom. And if you want to ask me again to marry you—I don't think—I shall say—No."

"I shan't ask you again," said Tom, gently but triumphantly, "for we were engaged all the time, Nancy—all the time; and we shall be married at once. It was the farm against the fates, Nancy—and the farm had to win. You know that, too!"

AJAX
ROAD KING

Farm service puts tires to the test—for the car or light truck on the farm meets all sorts of road conditions.

The splendid records established by the Ajax Road King on the farm, are proof of its ability to meet the test.

It is a tire with stamina—with the all round strength for all round service. Its heavy tread is braced and re-inforced by Ajax "Shoulders of Strength." Its side walls are extra heavy so ruts won't wear them down.

THE HOMIEST THING

By Anna Lenington Heath, Pomona

The Cultivator asks, "What is it you would choose to keep, if you must forego all but one of the happy, comfortable things in your home?" In the speech of the hour, "That's some question, I'll say." If I lived all alone I might choose this typewriter—if it were not for the rosebush on the front porch, the greasy little engine that drives the washing machine on Mondays, grandma's dictionary and the clothes rack that will go in behind the stove.

But there are five other members of this household whose choice of "homiest" things ranges from the dog through a case of books, hand needlework and a violin to a bed of brilliant poppies. Then there's the piano with its music, its pictures and the two giddy kewpies who shimmy when a heavy truck goes by. And the couch whose faded, homely cover and pillows would probably give an artistic decorator a headache or something, but which fits a tired back well enough.

We could never decide on any one of these material things. But there is that intangible home spirit that enables six markedly different individualities to fit in. It gives a comfortable livableness to the whole place and adds zest to all trips abroad because it is so good to come home again. Veriily, I believe our homiest thing is just a happy appreciation of home.

WHAT IS THE HOMIEST THING?

By F. N. Reasoner, Guinda

To me, there could be but one answer, that is, the thing which would be impossible to replace, even though I might hope to some day have an inheritance of thousands.

When I read the above question, I stopped to think. Then I began to make an inventory of my assets. First was my old violin, inside of which is printed "Joseph Guarnerius fecit, Cremonae, Anno 17. I. H. S." It is considered a fine violin, but I could buy one that would make good music and so would not be missed if lost in any way, so much as some other things.

Then there is the old organ which is like one of the family, but that, too, could be easily replaced. But what is in my home that money could not buy?

Taken as a whole, it is the library. I have books I think could not be found anywhere. Some were out of print when bought 50 or more years ago. I just picked up one yesterday that was published in 1746, and there are some older—good, useful, readable books yet. There are medical works, also religious, scientific, historical, books of travel and research, as well as fiction and poetry; books to suit all classes, from the little tot with his picture book to the old grandpa with his Bible and commentary.

"Rich man, poor man, beggar, thief, lawyer, doctor, merchant, chief" could each find entertainment on our bookshelves, which happen to be lug boxes nailed up in our pioneer cabin. I do not say but that under certain circum-

nces I might sell them, but there nothing else which would be so ich missed out of my humble dwell-g.

THE BATH ROOM

By Minnie C. Childs, Tustin

Taking for granted the absolute es-ntials of living, I would choose to ep the bathroom.

There is no question in my mind out it. The bathroom adds more mfort to the "homeness" of home an anything else. Every member of e family can enjoy its manifo'd essings.

The refreshing, regenerating, cleans-g power of a hot bath after a day toil cannot be overestimated. The vigorating tonic and afterglow of e quick cold plunge in the morning, llowed by a brisk rub that sends e blood tingling in healthful flow rough the veins, is something to be ankful for. It is luxury, happy ne-essity. "Cleanliness is next to godli-ss."

As a sedative for tired, jaded nerves, hot bath taken leisurely in a well lled tub, soothes, comforts and re-ores to normal, bringing a delightful nse of satisfaction, a quieting effect at induces sound healthgiving sleep, alns and aches disappear like magic the hot bath and the worldly cares nd frets melt away in the clean, self-especting feeling with which one merges from a good bath. It is a joy rever.

Some years ago a relative from the ountry visited me in my former city ome in Chicago. When the time came r her to return home, she said: "I ad such a good time—the opera, arks, plays, music, wonderful build-ngs and drives gave me so much leasure, but, My Dear, I believe I ave really enjoyed your bathroom ore than anything; the hot baths ere so restful."

I echo her words. In my home the athroom spells comfort.

THE HOMIEST THING

By Mrs. W. T. Newcomb, Santa Cruz

What is the homiest thing to me, he thing above all others that makes f my house a home? Well, though hey all contribute to the happiness of he home, we pass by the piano, the honograph, the roses, the view from he front, the grape arbor, the tele-hone and the auto, and there remain f the things mentioned by our editor, he two, the easy chair and the fire-lace. As there must be but one, we hoose the fireplace, which after all resupposes the easy chair.

I am nearing in years the three core and ten, but memory reaching ack through the years refutes the dea that age is the cause of my holce. The happiness of the present s always influenced by the associa-ions of the past, so though we are nly to write of the home of today, want to digress a little to speak of the old fireplace in the home that shel-tered my childhood and youth. If it is the center of cheer and comfort to-day what was it to the rural home of long ago? So many of the things in the home of today had not then been dreamed of. But while the broad old fireplace sent out its cheerful light and heat, to the childish heart, at least, there was no lack.

How many of the readers of the Cultivator can remember a fireplace so large that they rolled in the logs with hand spikes? I remember that the log was often covered with snow but it was soon crackling in its bed of coals. The broad hearthstone of real stone, so one could crack nuts on it, what a litter it held after an evening's revel! Sometimes we "sugared off" and waited patiently each with a pan of snow to try the wax. And any old person who had the experience will tell you that no confection ever equaled the maple sugar wax.

I shall never forget the winter my father taught me to sing by note. There was doubtless other light, but I think of the book as open across his knees while we read the music by the firelight. What a surprise it was when the sister who was too small to go to the village to singing school had learned a tune! It was a stately hymn and I hum it now sometimes.

But the old fireplace like the one I sit by today only represented the open fire of all the ages. Who shall ever analyze or define its charm! We close it up for long months while nature lures with a thousand wiles to the great out of doors, but like the friend in need it is ready with its cheer for the gloom and chill of winter. For long years, all of middle life, we lived where it was too cold to use the fireplace, and we often spoke of it as a distinct loss, but here on the sunset shores we have come into our own again. California with the timber and climate of the coast is truly the ideal home for the fireplace. So now while others may be busy with the tasks that come with the close of day we sit by the fireplace in the twilight with its dreams and memories.

THE FAVORITE PLACE FOR HOMEY COMFORT

By Florence Jane Garbutt, Princeton

We have a little court 18 by 20 feet opening from our little dining room. In one corner is a large fig tree, in another a climbing rose, and a grape arbor runs from its east opening to the kitchen garden. It has concrete floor. Little Lemonette trees bearing full sized edible lemons, with potted palms, suggest a tropical air. A cage of mocking birds is a most enjoyable attraction.

We have our hammock swing and lounging chairs here. A tea table also serves to make this a most inviting place for a social hour with family or friends.

The enticement of this homey corner is evidenced by finding this the favorite place for father to read the newspaper or mother to do the weekly mending and for the small members of the family to have their games as they run in and out among the trees and flowers in the yard adjoining.

What would we not give up rather than this quiet cozy place! We would forego the front porch and even front lawn or the fireplace if we were forced to sacrifice for it.

THE HOMIEST THING

By Helen Focht, Exeter

I always have loved to read stories and have a library with good books and literature in which to spend the warm vacation days. It is too far to any city or even friends and we are a long way from any company. This would be my greatest joy. Last summer at the age of 12 I spent most of my time reading and teaching my brothers and sisters, as they are smaller than I. I also love to write short stories and make up rhymes.

BARKER BROS.'

Fortieth Anniversary Sale and Annual Midsummer Clearance

which opened Tuesday, June 1st, with $1,453,000 worth of Furniture and Home Furnishings offered at most decisively lowered prices involving

Savings of 10, 20, 25, 33⅓ per cent

(a d even in some cases as much as 40 per cent and 50 per cent)

is a particular Vacation-time opportunity for two classes of Southern California home-lovers to better their homes.

These two classes are: 1, Those who plan to come to Los Angeles to enjoy their annual vacation in the city or at the near-by beaches; and, 2, Those who plan to stay home and enjoy a vacation under the roof of their own home.

Benefits the Buyer By Mail as Well as Those Who Come to the Store

Those who come to Los Angeles on their vacation during this Sale and Clearance will find the lowered prices—the savings to be enjoyed on merchandise throughout this store—of such extent and reality that it will be possible in many instances to pay the expenses of their vacation from the savings in cost on their Furniture purchases. Or these savings might mean a longer, better vacation.

Those who will not be in Los Angeles for their vacation this summer, who have decided instead to stay at home and create their own enjoyment by "doing over" some part of their home's furnishing, through a renewal of part of its Furniture, its Floor Coverings or its Draperies, have the same opportunity to SAVE, to enjoy the REDUCED PRICES of this sale. It is their privilege to BUY BY MAIL at exactly the same favorable sale prices and terms as those able to come to the store in person.

Any of the Thousands of Articles in This Sale May Be Bought By Mail With Certainty of Satisfaction

Barker Bros.' Mail Order Department serves thousands every month who find it impossible or impractical to come to Los Angeles. It brings this great, interesting store right to your door—it serves you with the same consideration and courtesy as though you were here in person—it brings you the benefits at this time of reductions in price on more than ten thousand pieces of furniture.

The Sale in Dollars and Cents

Living Room Furniture	$325,000.00
Sleeping Room Furniture	300,000.00
Dining Room Furniture	210,000.00
Linens, Bedding, Mattresses	205,000.00
Draperies and Wall Papers	159,000.00
Floor Coverings	100,000.00
Pianos and Phonographs	60,000.00
Lamps and Art Wares	60,000.00
Stoves, Housewares, Dinnerware, Electrical Devices, etc.	14,000.00
Reed and Fibre Furniture	9,000.00
Used Furniture	6,000.00
Office Furniture	5,000.00
Total	$1,453,000.00

(Any goods upon which the manufacturers maintain fixed prices arbitrarily throughout the country must necessarily be excluded from the offerings of this Sale.)

Inquiries regarding any of the articles in this sale will receive attention of the Mail Order Department on the same day as received. Address

722 South Broadway — Barker Bros. ESTABLISHED-1880 — Los Angeles Cal.

COMPLETE FURNISHERS OF SUCCESSFUL HOMES

MOLINE

The Universal Tractor

THE Moline Universal Tractor makes possible a real system of Power Farming instead of tractor plus horse farming. It does not reverse the old-established order of farming. It does not add expense—but cuts it.

It places the power of nine big horses where the horses stood. It is operated in the same manner as horses—from the seat of the implement. And it does all the field work that horses do, including cultivation of row crops.

It adds more power and speed to an old principle. And if this principle isn't correct, then farming has always been done backward, and you would be operating your implements from the horse's back instead of from the seat of the implement. Saddles instead of seats would have been in general use.

This is the reason for the great success of the Moline Tractor. It is built on the correct principle. One man with one tractor does all field work from plowing to harvest.

Moline Power Farmers are increasing production and decreasing the cost of production.

The Moline System of Power Farming offers a particularly helpful solution of the farm labor problem.

You will find the Moline Universal Tractor a sure, safe, satisfactory and highly profitable investment.

Evolution of Long Staple Cotton

By M. E. Bemis

SOMETIMES we wonder what some of the people who have been instrumental in developing the country would say if they could look back and see things as they are at the present time.

We, here in the Salt River Valley, sometimes wonder what Jack Swilling would say if he could take a look at the Salt River Valley and see what has grown from the little beginning which he and his band of pioneers made some half a century ago when they took the first water from the Salt River out on the desert and founded the city of Phoenix.

Arizona Cotton Field

Cultivation of cotton is now the principal work of the farmers of Arizona. All agree that cultivation is a prime requisite to growing a crop of cotton.

With the long staple cotton industry, however, it is different. We do not have to wonder what those who are responsible for its development think of it, for they are alive and for the most part participating in the prosperity which has come in consequence. There is nothing comparable to the development of the long staple cotton industry unless it be the achievements of those East Indian magicians who wave a wand and behold a tree grows before one's eyes.

It has been only a few years ago, seemingly, that the first cotton was grown in the Salt River Valley. The government had done considerable experimenting, beginning about 1900, the first planting being at the government station at Yuma. These experiments were not indicative of the success which has since been achieved, and in lieu of abandonment the experiments were transferred to the government station at Sacaton on the Pima Indian Reservation, about 50 miles south of Phoenix on the Gila River, but with practically the same soil and climatic conditions as in the Salt River Valley. Here under the direction of such men as Kearney and Cook of the United States department of agriculture, and under the supervision of E. W. Hudson, there was gradually evolved a plant which was adaptable to the climate and soil and artificial water conditions of the Salt River Valley and similar locations. This first variety in length of staple and quality of fiber very closely resembled the Egyptian from which it originated but showed qualities markedly superior to the original plantings. By 1912 this cotton had reached a stage where those in charge of the experimental work felt it could be safely tried on a commercial scale.

In the meantime Herbert Atha had been studying the possibility of growing cotton and was willing to plant a considerable acreage. This first planting was 200 acres and the same season a number of farmers in the vicinity of Mesa and Tempe planted a total of about the same acreage, making in all 400 acres of cotton. There was

(Continued on Page 950.)

A Little Fortune

A load of seed cotton that weighs 10,230 pounds. At a very conservative estimate this load of cotton would be worth $2,500. Note that cotton is hauled to market in trailers, behind trucks.

THREAD-RUBBER INSULATION

STORAGE BATTERY

Willard

THIS trade-mark is branded in red on one side of the Still Better Willard—the only storage battery with Threaded Rubber Insulation.

136 passenger car and truck manufacturers have selected this battery, knowing from experience that Threaded Rubber Insulation is far superior to wood or any other form of storage battery insulation.

California Cultivator

Vol. LIV, No, 24 | Los Angeles, June 12, 1920 | One Dollar Yearly

Make 1920 a Silo Year

By R. P. Royce

IN MANY sections of this state the present season is certain to be a trying one on the livestock producers, owing to the shortage and consequent high price of feed. Even now they are beginning to feel the pinch, and before winter is over the problem of feed is bound to loom large.

In many parts of California the grain crop has been seriously cut. Thousands of acres given over to grain hay production have yieided the shortest crop in years. In the big interior valleys the lack of water for irrigation purposes means a light alfalfa yieid. With the above condition staring us in the face, the big question is: What are we going to do about it? Which is the best way out? A number of plans suggest themselves—

A Sound Form of Insurance

A battery of six silos in use at the university farm, Davis. Every California ranch, carrying cattle, should have one or more silos. It is good business.

but standing out clear, the safest, sanest, soundest, surest and most practical relief is the silo and silage. If there ever was a time when a silo couid prove its value and economy, it will be this year. The man who owns a silo shouid make all his plans early to see that every inch of silo capacity is packed with the best available crop.

The man who owns no silo will be displaying the highest sort of common sense if he sets about now to build one. This year is no time for procrastination in the matter of silo building, and if there be a man who still is unconvinced of the value of silage, he had best lay his prejudice aside and seek a hasty conversion. A silo is a valuabie adjunct to any farm carrying cattle or sheep, in a good year; it is a life saver, a profit maker and a positive necessity in a year of short crops. The value of a silo is no longer questioned by any man. The value of silage has been proven in every section of the United States, and today no livestock producer who professes to be progressive and who is in the business with the expectation of making a profit from his investment and labor should be without one. The silo proposition from a "cold turkey" standpoint is a business proposition and nothing more and can very easily make the difference between success and failure.

We don't know how many silos there are in California, but, regardiess of the present number, there are not enough. Indeed, California will never have as many silos as are needed until there is at least one on every farm carrying cattle.

In planning a siio for a particular farm, the choice will be governed very largely by local conditions. In general, siios are constructed of wood, concrete, hollow tile, brick, stone and galvanized iron. In some localities the pit silo, an excavation in the ground, has proven satisfactory. Practicaliy the only type of silo now in use is round. The preference for the round silo is due to the fact that a circular siio is more easily filled and packed and the siiage keeps better.

The theory of siiage is but little different from the theory of canning or preserving vegetables and fruits. Silage makes availabie succulent feed at a time not otherwise possible. The keeping qualities of silage are dependent upon the exclusion of air. The more nearly air tight a silo the better the silage keeps, hence it is important that whatever type of silo is built it be as nearly air tight about the sides and doors as is possible. It is likewise important that the silage be firmly packed in order to exclude the air.

The majority of silos are constructed of wood staves. Generaliy speaking, the first cost of a wood stave silo is below that of other forms of construction. Siiage keeps quite perfectly in wood. In building a siio of wood, it is important that only good material be used. Our native redwood is among the most popular woods. Redwood is not subject to shrinkage and swelling and is but little affected by silage juices. Cypress, Oregon fir, tamarack, white pine and yellow pine are also used. Wood silos must be looked after with care when empty, as very often the staves shrink and unless the hoops are kept tight the silo falls down.

Silos of concrete, when properly reinforced, are in every way satisfactory. Such silos, while more expensive, have the advantage of durability over the wooden type. Occasionally some trouble has been experienced with silage acids attacking the walls, but that trouble can be overcome by painting the inside walls with a coat of tar. There are many types of cement silos in use. Some are made with cement blocks, either hollow or solid; others are made from cement staves. The latter type give fine service if properly erected. The hollow tiie silo is becoming very popular. Brick and stone are sometimes used but are not as popular as hollow tile. Silos made from galvanized iron are sometimes seen. They are entirely satisfactory but are not in common use.

As stated above, the type of construction will be governed by local conditions. The kind of silo built is not so important as the building of a siio.

The size of silo naturally follows the size of the herd. In this connection, however, one shouid make due allowance for possible increase in the herd, and it is always good judgment to buiid with a margin over actual needs. In determining the diameter and height estimate shouid first be made of amount of silage required. The builder should then keep in mind that the diameter shouid be such that during cool weather at least two inches of silage is removed per day and during warm weather at least three or four inches. The reason for removing such amounts daily is obvious. Silage exposed to air soon spoiis, and once the silo is opened it should be pianned to remove a depth sufficient to keep ahead of any deterioration. More silos are made too large in diameter than otherwise. The foilowing table should assist in determining the proper size and dimensions:

Data on silo capacity given in this table are based on the weighing of silage for five years in from three to five silos at the University of Nebraska Farm, and reported by Prof. L. W. Chase in Circular No. 1 of the University of Nebraska agricultural experiment station.

Inside Diam.	Height	Cap. Tons	Lbs. Fed Daily
10	25	31.8	525
10	30	46.6	525
10	35	60.7	525
12	30	58	755
12	35	73	755
12	40	88	755
12	45	104	755
12	50	120	755
14	30	80	1030
14	35	99	1030
14	40	120	1030
14	45	141	1030
14	50	164	1030
16	30	104	1340
16	35	129	1340
16	40	156	1340
16	45	184	1340
16	50	214	1340
18	30	132	1700
18	35	164	1700
18	40	198	1700
18	45	234	1700
18	50	271	1700

The approximate amount of silage required in feeding operations can be computed from the following prepared by the Iowa state agricultural college, giving daily ration in pounds:

Beef Cattle—Wintering calves eight months old, 15 to 25 pounds. Wintering breeding cows, 30 to 50 pounds. Fattening beef cattle 18-36 months old; first stage of fattening, 60 to 30 pounds, latter stage of fattening, 30 to 12 pounds.

Dairy Cattle—Cows, 25 to 45 pounds; heifers one to two years, 10 to 20 pounds; bulls, 10 to 20 pounds.

Sheep—Wintering breeding sheep, two to six pounds; fattening lambs, one to three pounds; fattening sheep, one to four pounds.

If other roughage is fed as in case of sheep or cattle, they will eat less silage. Two and one-half to three pounds silage replaces one pound hay and some grain in addition.

In this state there is a rather wide range of crops suitable for siloing, and the choice of crop will depend upon local conditions—location, soil, water, labor, etc.

Speaking generally, Indian corn has proven the most satisfactory ensilage crop, and in sections of California where corn can be successfuliy grown it will no doubt be advisable to use corn. Corn silage is so universally used that it is useiess to go into details concerning its value or method of production. The more common practice now is to permit the crop to become quite mature before cutting. In making silage it should be borne in mind that the greener the crop the more acid (sour) the silage and, conversely, the more mature the crop, the sweeter the silage. In siloing well matured crops it is a common practice to add water at the time of cutting. The amount of water to be added must of necessity be governed by one's judgment.

Next to corn, from the practical feeder's standpoint, the sorghums, milo maize and similar forage crops are preferred. Such crops can be grown in many sections of California with greater success than corn, especially where the securing of water is a factor.

The college of agriculture, University of California, has conducted numerous feeding trials with sorghum, milo and feterita silage, and the results are reported in bulletins that may be secured upon request to that institution.

Los Angeles County Farm Silos

A California Cultivator photograph taken at the time of the farm bureau meeting on the Los Angeles County farm near Downey, showing two types of silos in background which have added much to the profitableness of the Los Angeles County farm. Supervisor Dodge is making welcoming address. Advisors Hodgson and Gordon stand with back to the camera in foreground.

Sudan grass is a crop that can be successfully produced and siloed. Sudan grass returns a large tonnage per acre, and while of lower feeding value than corn silage, it has as an advantage the fact that it can be grown under conditions where corn production is not practical.

Legume crops, alfalfa, clover, cowpeas, soybeans, etc., do not make as

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

RENEWING PASTURES

Well toward middle June Humboldt receives the blessing of a great shower, 1.28 inches, according to the press, "estimated to be worth more than one million dollars." The great blessing of the shower is more appreciated than it would have been in any preceding year, for the reason that this has been a year of rather short precipitation. The shower touched all the northern end of the state and was especially heavy over western Oregon.

GOOD BUSINESS

The Republican convention is on in Chicago this week. It will be a most interesting week. It will be a week meaning much to the history of the world. We note that while one chairman and one secretary are deemed sufficient, a whole battery of chaplains is necessary—something over 57 varieties. It will later devolve on the Democrats to go at least one better.

REDUCING FOOD PRICES

Under the title of "The Remedy for Profiteering and High Prices," the Railroad Brotherhoods and Unions make a statement which shows how wonderfully easy it would be to reduce food and other costs if "all corporations and firms should be required to make restitution to the public of all excess profits which they have exacted." If the word, "labor," had been inserted after firms it appeals to us that high prices would sooner feel the effect of the pressure.

WINNING HONORS

The article on fifth page of this issue indicates the remarkable showing made by California in one of the greatest Holstein events of the country. California's pure bred Holsteins commanded highest prices in the great sale held at St. Paul. That great youngster of the Morrises, a photo of which was shown in the Cultivator of April 24, with his mother, Tilly Alcartra, went under the hammer for an even $50,000, two dairymen of Canada uniting in making the purchase.

Congratulations to Canada, though we wish the youngster had been returned to this state. But Tilly Alcartra and some of her best blood still remain.

FLAG DAY

Monday, June 14, is Flag Day. On the 14th of June, 1777, congress enacted "The flag of the 13 United States be 13 stripes, alternate red and white; that the union be 13 stars, white in a blue field, representing the new constellation." The number of these stripes and stars was increased to 15 because of Vermont and Kentucky becoming members of the American union, but in 1818 congress ordered that the 15 stripes be reduced permanently to 13 and that the addition of each new state be indicated by a new star in the union. The blue field has been filled with new stars until there are now 48, and the flag has become the symbol of the mightiest nation on earth. Let us all fling the stars and stripes to the breeze on June. 14. "May it greet the rising and salute the setting sun and float all day long from every church edifice, school, and building, public and private, however humble, through the entire land."

I pledge allegiance to My Flag and to the Republica for which it stands, one Nation indivisible, with liberty and justice for all.

FRUIT MEN CONCERNED

With the sugar shortage, car shortage, labor shortage, and other shortages too diverse to mention, the fruit grower has a problem. These various shortages have caused the canners to lose some of their interest and the fresh fruit shipper to refuse to speculate, so that there is an uncertainty in the air which causes the grower to ask: "Where are we at?" We believe the answer will come, and soon, and that it will be satisfactory to the grower. Prices as yet are holding up in all retail centers. The price cutting flurry of a few weeks ago seems to have ended, as it was predicted, merely as an advertising scheme. In any case, the wise grower is continuing the best care possible of his fruits and producing highest grades.

Quality always commands attention.

WAR BONUS

One of California's loyal sons, now living in Kings County, takes exception to our War Bonus editorial last week. Our subscriber writes:

As a regular reader of your paper and one who considers your stand on many of the most important questions before the nation today to be the very best, I am surprised at your "War Bonus."

Will mail you a copy of the "American Legion" and think it explains the feelings of the men better than I can. May I ask you some questions and if you wish further information on any of these subjects it could be gotten from any Legion post or the national headquarters at Indianapolis.

How many organizations are banded together "for God and country and to uphold and defend the constitution of the U. S. A.? In our present unsettled condition is this worth anything?

That the incapacitated who have received help and vocational training are only a fraction of what the people think and that orders were actually given to treat them rough and make them feel they asked charity instead of justice?

Of the unions who asked for increases that were not granted, who could not quit and whose every act was subject to court martial, which included death or such other punishment as might be directed?

As an enlisted man of 16 months service—and it included about everything from washing dishes to shining shoes—I could use a government loan to replace a bank loan, short term, eight per cent interest, on a farm, but if the people of the country feel this is asking too much, surely I can stand it, but think as others have said, if it is for the glory alone let some of the others have a chance at the glory next time. Very truly yours, Wesley G. Clark.

As to the first question: We hope there are many organizations banded together "for God and Country and to uphold and defend the constitution." Surely there is one, and that is the Legion of which Mr. Wright is a member. Its members are those who stood squarely by their duty when their country needed defenders They stood four square when a certain labor element in the Northwest was making every effort to vilify the flag. They have always so stood, and always will. for it is a worthy organization and will be supported as long as service men of the Great War live. But besides that one specific organization there is a greater and grander, with more than 100,000,000 of membership, the grand old U. S. A.

There were sacrifices made by so many at the front and at home in every section of our broad land that can never be recompensed excepting in the satisfaction of duty well done, that we regret to see any one body asking special reward. In the minds of the people of the country it is not a question of the service men asking too much; they could not do that; the service they have rendered is beyond compensation. The point is it is a physical impossibility to extend the rewards as far as should be. But by all means the country should care for those who in rendering the service became incapacitated and for the dependents of those who never came back.

FIRE PREVENTION SLOGANS FOR SMOKERS

Suggestions Which Secretary Meredith of the Department of Agriculture is Asking Tobacco Manufacturers to Pass on to Smokers

Don't drop fire when you smoke in the woods, nor throw it out along the road. Keep the forests GREEN!

Danger! Matches, pipe coals, cigar stubs, and cigarette ends start many forest fires. Help protect woods, streams, scenery.

Be Careful! Don't start a fire in the woods when you begin or end your smoke! Be sure your match, cigarette or pipe is OUT.

Don't Start What You Can't Stop! Be careful with fire in and near the forest.

Fire is Dangerous! Be careful when you smoke in the woods.

Look Out! When you smoke in the woods, don't start a forest fire.

Your cooperation to keep down forest fires is asked. Break your match in two. Knock out your pipe ashes into your hand. Don't drop a burning cigarette.

Forest fires cost millions a year. Don't start one.

Don't throw fire away in the woods or along the road.

HELP PREVENT FIRES

WHAT'S THE IDEA?

Congress has adjourned. It is but a few years since the first "billion dollar congress" adjourned and the country asked: "What is the world coming to?" With the war over—in fact, if not by treaty—the congress which just adjourned proved itself a five billion dollar congress, but with the enormous appropriations necessary to keep the great machine greased up it was necessary that there be economy somewhere. Naturally, the economy was practiced along agricultural rather than industrial lines. Agriculture asked for nearly 40 millions of dollars. It got 30, or a little better.

One-third of the population of the country is engaged in agriculture; one-fourth of the national wealth is invested in farm enterprises; yet out of the total of five billions agriculture gets 30 millions.

In appealing for fairer treatment for agriculture Senator Arthur Capper said in the senate:

"Mr. President, the young men of the farms are not fools. You can not hand them a further supply of inflated atmosphere about the beauties of farm life, and then ask them to produce hogs at a loss of $5 or $6 a hundred and make any impression.

"In my own state of Kansas the young men know that there was an increase of 190 per cent in the proportion of tenants from 1860 to 1910—and the census of this year is going to show a still more alarming condition. The farmers cannot continue to pull themselves up by the boot straps on this land question—especially with the price of hogs below production cost. There is one county in Kansas—Sumner—with 55 per cent of tenants; and you know what that indicates. And here is another example, in Lincoln township in Pratt County, where there were 13 per cent of tenants in 1880, there are now more than 60 per cent. And you will find the same conditions in Missouri and Illinois and Indiana and Ohio and all points east. Dekalb County, Illinois, for example, has 72 per cent of tenants.

"In order to get a nation wide view of the situation, let us consider for a moment the percentage of tenants for the United States as a whole, as shown by the census. This percentage in 1880 was 25.6; 1890, 28.4; 1900, 35,3; and 1910, 37. Many of the leading thinkers on agricultural economics believe that the census of this year will give a percentage of between 45 and 50 per cent, with hundreds of counties above 60 per cent, and perhaps some as high as 75 per cent.

"But as a start in a constructive program, let's first eliminate profiteering, encourage cooperation, and take up a study of the land question and taxation. Let's try to stop this landslide from the country into the cities. Let's get a vision of what this great nation can be, Mr. President, with its industrial and business life working in harmony and perfect cooperation with the agricultural interests, and with plenty of food for everyone at prices which the workers can afford to pay and yet which will supply modern country homes and other essentials for farmers. If we have the wisdom we can work this out. The food question is fundamental. The nation's future must be worked out with this in view."

Notwithstanding this and other equally as strong appeals, appropriations were shaved until the department of agriculture now reports that much of the experiment station service must be eliminated, its activities curtailed all along the line, that the bureau of markets will suffer and, in fact, that many other activities of the department will be eliminated because of the cutting off of some nine or ten millions actually needed in the department work.

California Holsteins Triumph at Eastern Sale

By R. P. Royce

THE most sensational event in the livestock history of California occurred last week when 11 head of California Holsteins, three bulls and eight females, from five California herds consigned to the National sale held at St. Paul, sold for $124,960, an average of $11,360—a world's record.

The grand total of this sensational sale for the 237 animals sold was $728,775, an average of $3,075. At the close California had the top individual of the sale and the high average for all states consigning. California won the first prize for consignments. The above average stands as a world's record.

Alcartra King Sylvia, the three months old son of the wonder cow, Tilly Alcartra, owned by A. W. Morris and Sons, Woodland, sold for $50,000, a world's record price for a calf of that age, to A. C. Hardy and W. R. Shaw of Canada.

King Korndyke Pontiac Acme, a 15 months old son of King Korndyke Pontiac 20th, the $12,000 bull recently sold by W. J. Higdon, Tulare, to Burr Farm, Los Angeles, and from Miss Aaggie Acme Burke, a world's record two year old, was sold by the Morris firm to Santa Anita Rancho, Santa Anita, for $41,000. Santa Anita Rancho bred King Korndyke Pontiac 20th and sold him as a calf to Mr. Higdon for the then California record of $6,500. King Korndyke Pontiac Acme has the distinction of being the highest priced bull of any breed owned in this state and has for a sire a bull that twice held the record of being the highest priced bull ever sold at auction in California.

Ruby Pietertje of Forest Hill 2d, the champion 30 day cow of the Pacific Coast and holder of the largest seven day record reported in the United States last year, was consigned by W. J. Higdon and purchased by Wheatfield Farms of Wisconsin for $10,500.

Moxee Johanna Korndyke Piebe, a three year old daughter of Sir Korndyke Ormsby Piebe and out of Cascade Fleta Johanna, that has a junior four year old milk record of over 30,000 pounds, consigned by Toyon Farms Association, Los Altos, sold for $10,000. Another consignment of Toyon Farms was Princess Jonge Buckeye, a mature cow with a 365 day record just completed of 1,051 pounds of butter from 27,906 pounds of milk, sold for $2,650.

Morris and Sons also consigned two heifers that sold for $3,300 and $1,700 respectively.

Bridgford Company, Patterson, and the J. S. Gibson Company, Williams, were also consignors, but at the time this is written it is not kuown the individual prices secured for their consignments. Full details of this epoch making event will be given next week.

Naturally the livestock breeders of California will be gratified over the prices paid. Each set of breeders, regardless of their breed affiliations, will join in whole hearted congratulations to the progressive Holstein breeders who have brought such distinction to our state.

But after all the greatest source of satisfaction lies not in the amount of money paid for the California productions, but rather in the fact that the exploit of the Holstein men has once again, and most conclusively, proven to the world that we have in this state every condition necessary to the production of the very finest quality of livestock, that our breeders are as capable as will be found in any section and that the past exploits of California breeders have been no happenstances.

From now forward California has a very definite and secure place in the livestock affairs of America. Such being the case, let all breeders take added heart and enthusiasm in their operations. Let breeders of every class of livestock resolve that they will not be content with less than what has been done. Let them base their operations on the solid rock of essentials. Let them not be discouraged with any temporary unfavorable conditions. Success will not come in a day. But success will come to other breeders just as certainly as it has come to these pioneers provided others will apply the same degree of persistency, hard work and constructive effort. The way has been blazed, and all can follow the path. Individual and collective cooperation among our breeders will make for that success that lies just ahead.

There is another point that should not be lost sight of by the rank and file of our livestock producers, the men who are not concerned in the production of pure bred livestock. That point is this: The basis for values in pure bred livestock of all breeds is the ability of well bred livestock to increase the efficiency of the common stocks. Men who breed the great producers are not faddists; with few exceptions they are hard headed business men. Men who pay long prices for such producers usually do so because they need those individuals to increase the efficiency of their herds—they, too, are level headed business men. The value of well bred livestock is very real.

Therefore it would seem that men who are trying to make their living from the handling of livestock of whatever kind would adopt with greater facility the methods of the successful breeders. Pounds of beef, pork, butterfat, milk and wool can be increased through the use of better bred sires and dams. It is just a business proposition—and nothing more. Are you, Mr. Livestock Reader, a good business man?

Dairy Branch of the Los Angeles County Farm Bureau Being Photographed

When the farm bureau recently met on the Los Angeles County farm near Downey, there were practical institute meetings in the corrals with the dairy cows, but the social side was not neglected, for at noontime the whole gathering was given a remarkably fine luncheon on the grounds in front of the home of Superintendent and Mrs. Harriman.

Practical Farm Bureau Work

Dean Van Norman at the farm bureau meeting discussing points indicating high dairy type.

Poultry Producers Confronted by Serious Situation

By M. A. Schofield in Address Before Poultry Institutes

The poultry industry in Southern California will be under heavy pressure for probably six months to come. In other words, the price of eggs has not kept pace this spring and summer with the increased cost of production. The number of eggs in storage this year is about three quarters of a million cases short of the holdings last year. Ordinarily this would indicate a condition favorable to the grower this fall and winter. We have to meet, however, the hostility of the consumer as regards high prices of eggs and dairy products. I believe that this comes from misinformation. Agitators have for some reason chosen eggs and dairy products as a point of attack. Not unlikely the reason for it is because there is available no means at present for combating the misinformation disseminated.

This opens up the question of an advertising compaign as a means of acquainting the public not only with the quality of the producer egg, but also the difficulties surrounding the poultry industry at present and explaining to the public why eggs must be high, present circumstances considered.

The American people as a whole aim to be fair, and the organized poultrymen have a great opportunity at hand for bettering the understanding between the producer and the consuming public. I believe that forthwith steps should be taken to provide a fund for advertising purposes. One-tenth of a cent per dozen and ten cents a case on all storage packed eggs would create a fund in the course of a year that would work wonders if judiciously used. The organized poultrymen should also keep in mind the benefits which come from marketing the by-products from the poultry ranches to the best advantage.

So far as broilers are concerned the problem is already handled successfully. The broilers under the producers' contract are moving to New York at a substantial profit to everyone concerned.

We are face to face with the sale of great numbers of Leghorn hens this fall. Some growers believe that there must be marketed this fall in the neighborhood of 800,000 hens south of Tehachapi. Probably one-third of these will not reach the ordinary channels of trade, but the marketing of the remainder seems a tremendous problem. If California continues to increase in the production of eggs, the Leghorn hens will naturally increase also, and the problem of the sale of these hens is one of the things that the organized poultrymen can still consider as a part of the service to their stockholders. The purchase of feed and supplies, confining their activities to a limited number of commodities, has long been considered, but up to the present no solution has been found.

Permit me to say in conclusion that in my opinion the organized poultrymen but faintly realize the tremendous opportunities which such an organization has for increasing the income of its members directly and building up the poultry industry as a whole. By lending the prestige of the organization, by extending a limited amount of credit to new enterprises judiciously, and working out constructive plans, I believe that the stockholders have scarcely dreamed of the possibilities of an organization composed of 530 active poultrymen and a paid in capital soon to be $100,000.

Agricultural News Notes of the Pacific Coast

Northern California

There is a good crop of cherries this year.

Solano County unveiled a monument to its soldier dead at Fairfield, May 30.

The annual Butte County farm picnic was held on May 29 at the Durham colony.

Stockmen of the Livermore section say that coyotes are being wiped out by disease.

Chico, Butte County, is planning for a big community picnic on July 5 at Bidwell Park.

It is reported that hydro-electric companies are using airplanes to scout for power.

Prune growers of Sutter County report several contracts made on a 12 cent per pound basis.

Roy McCune of Wyandotte has been elected president of the Butte County farm bureau by post card ballot.

Hot weather the last of May ripened strawberries very rapidly and owing to shortage of cars some fruit was lost.

Richfield and Proberta centers of the Tehama County farm bureau have discontinued meetings for the summer.

Los Molinos, Corning and Richfield farm bureau centers held poultry culling demonstrations the last part of this week.

Sutter County peach growers say they hear many rumors of offers of $60 to $100 per ton, but they don't see the buyers.

The state commission on housing and immigration is making inspection of living conditions in labor camps of the Delta section.

The cantaloupe crop of the Sutter basin district will be ready to move in July. Growers say they expect to get a car to the acre.

Plans are being made for Butte County's agricultural fair to be held this fall. The farm bureau will take a prominent part in the preparations.

The celery acreage in the Sacramento district, which includes Walnut Grove and Antioch, has been cut 700 acres from the previous estimate of 2,600.

Examinations for students not having high school education who wish to enter the farm school at Davis in the fall will be held at the school June 14.

The Tehama County farm bureau announces local meetings at Oak Park, June 17; Corning, 17; Bend, 18; Liberal, 24; Manton, 25; Bowman, 26; Los Molinos, 28.

The cattle protection office of the state department of agriculture is still occasionally making arrests because of slaughtering without inspection, also because of branding with unrecorded brands.

R. L. Nougaret of the office of viticulture of the department of agriculture says offers are being made of $50 to $70 per ton for fresh wine grapes and 16 cents per pound for the dried product.

The Humboldt County farm bureau is making a special membership drive and calling attention to the fact that in Iowa a farm bureau drive was made on the basis of every farmer paying annually five dollars per year for life.

Central California

Dates chosen for the Tulare fair, September 14-18.

San Jose held during the past week an industrial fair.

The Consolidated cannery at Reedley has begun on apricots.

The cannery at Porterville began operating on apricots, June 7.

Field men are busy signing up growers of peaches and figs in the new association.

A number of cantaloupe fields in the Turlock section have been destroyed by jackrabbits.

Farm bureau auction sales of livestock will be held at McFarland, June 12; Bakersfield, 19.

The various fire units of Modesto County have decided to organize a regular paid patrol force during May, June, July and August.

It is now thought that shipment of cantaloupes from Turlock will begin about the middle of July.

The farm bureau of Santa Cruz County held its annual picnic at Brighton Beach, Saturday, May 29.

Hot weather is melting snows in the Sierra so rapidly that Kings River is threatening to overflow grain lands about Tulare Lake.

The Tulare plant of the California Cooperative Canneries expects to employ about 200 men and women on the initial run next week.

The minimum wage for women employed in fruit and vegetable packing has been increased from $13.50 to $16.00, effective July 24.

Tivy Valley, Fresno County, has been fighting grasshoppers. Commissioner Roullard states that over 1,000 persons took part in the campaign.

The interstate commerce commission has issued priority orders to insure adequate shipment of tin plate to fruit growing sections of California.

Fruit growers of the San Joaquin Valley report great silence from canners and dryers who last year were keen competitors in buying offerings.

The Tulare plant of the California Cooperative Canneries will begin its season's run about June 15 and expects to be in operation for four or five months.

The chamber of commerce of Oakdale, Stanislaus County, is preparing an exhibit for the state fair. It is thought that almonds will be made an important feature.

Meetings of the farm home department of the Kern County farm bureau will be held at Weed Patch, June 15; Kern Delta, 15; Beardsley, 17; Wasco, 24; Edison-Fairfax, 25.

Santa Clara Valley dried fruit producers and canneries recently received notification that through bills of lading would be issued and that ocean rates would be materially reduced.

Tulare County grape producers are trying the sulphur cure for grasshoppers. Sulphur is placed on sacks, set on fire and dragged through the vineyards. It is declared the hoppers leave at once.

Merced County farmers have agreed to give aid so far as possible to the new settlers in the Delhi land settlement colony. The settlers are now holding bi-weekly meetings in addition to regular farm center meetings.

Southern California

The poultry institute at Van Nuys was well attended.

Bean planting is all finished and the crop coming on fine.

Many brush and hay fires are reported over Southern California.

Brawley, Imperial Valley, shipped out 108 carloads cantaloupes, May 30.

The bean warehouse at Smeltzer, Orange County, has been closed for the season.

Yucaipa Valley cherries are just beginning to ripen, some two weeks later than usual.

The state university will give a series of poultry culling demonstrations in Imperial Valley.

The sugar beet crop of Hansen Station, Orange County, is reported in better shape than last year.

Cotton ginners of the Imperial Valley have approved the contract of the Imperial Valley Growers Association.

Professor R. S. Vaile of the experident station at Riverside talked summer cover crops to the La Habra farm center last week.

The election held recently at Garden Grove, Orange County, to organize a drainage district shows only four votes in opposition.

C. B. McCall of Garden Grove sent samples of his milk to the National Competitive Dairy Show at Chicago and received a score of 98.

Farm Adviser Wahlberg of Orange County held on June 8 a drainage demonstration and field meeting on the Hellman estate west of Garden Grove.

Members of the Banning Fruit Growers Association recently held their annual banquet and discussed matters of harvesting and hauling fruits to canneries at Hemet, Ontario, or Riverside.

Los Angeles potato shippers are finding difficulty in getting sufficient cars to carry potatoes East. Growers have been paid as high as $7 per sack for spring grown potatoes for Eastern shipment.

Superintendent of Public Markets Boothe of Los Angeles says that an effort is being made to save the unmarketable cabbage of the San Fernando Valley by sending it to dehydrating plants.

Cabbage growers in the vicinity of Los Angeles, because of strikes preventing shipment in the height of season, are now selling cabbage at the roadside at one cent per pound and in some cases giving away.

The fifth annual poultry institute, conducted under the auspices of the state college of agriculture, is being held at Van Nuys school this week. It is under the direction of the Los Angeles County farm bureau.

The United States bureau of markets has located at Brawley, Imperial County, a field station for gathering and disseminating marketing information on potatoes, tomatoes, cantaloupes, watermelons and peaches during the shipping season.

The Orange County farm bureau will hold local meetings at El Modena, June 14; Yorba Linda, 15; Capistrano, 17; Buena Park, 21; West Orange, 22; Citrus Institute, Santa Ana, 24; Villa Park, 24; citrus institute, 25; La Habra, 25; Garden Grove, 28.

The Coast and General

June 6-11 was Rose Festival Week at Portland, Oregon.

Chautauqua sessions will be held at Pasco, Washington, June 13-18.

Farmers Chautauqua at Yakima, Washington, June 22-23; Spokane, 23-24.

Farmers of the Chandler district of Arizona have organized a farm bureau.

The Rocky Ford district of Colorado has about 7,000 acres planted to cantaloupes.

Eleven granges were organized in the state of Washington in the first three months of 1920.

A convention of the Inland Dairy Producers will be held at Spokane, Washington, June 15.

Congress has passed a bill taxing grapes which are to be used for making non-alcoholic juice.

Potato growers of Spokane County, Washington, have organized to secure more satisfactory prices.

The Farmers Union elevator at Palouse, Washington, has just been completed at a cost of $30,000.

Inland Empire Dairy Producers will hold their annual convention at Spokane, Washington, June 15.

The U. S. biological survey is leading in the campaign to kill off coyotes on sheep ranges of Arizona.

The Farmers' Union at Waitsburg, Washington, has purchased a 40,000 bushel lot of wheat at $2.50 per bushel.

Starting Sunday, May 23, the clocks of Vancouver, B. C., were set ahead one hour to save daylight, until September 18.

A two day dairy school was held recently at Medford, Oregon, under the auspices of the Jackson County farm bureau.

The University of Idaho is advocating dipping potatoes in a solution of corrosive sublimate to check development of disease.

The United States railroad administration issued a statement placing Yakima County, Washington, fourth among counties of the United States in crops produced.

The Pomona grange of Spokane County, Washington, has leased the warehouse in Spokane, where it will install a cooperative wholesale and retail store.

Federal grain grade demonstrations will be held at Pendleton, Oregon, June 14; Enterprise, 14; Imbler, 14; Baker, 17; North Powder, 18; Ione, 21; Grass Valley, 22.

Owing to unwillingness of Michigan farmers to grow sugar beets at prices offered by the factories, it now looks as if bean planting would be much larger than anticipated.

According to estimates of cantaloupe distributors at Phoenix there are 2,450 acres planted to cantaloupes in Arizona this year, as against 4,500 last year. The backward season is largely blamed for the shrinkage.

Dairy producers of Coos County, Oregon, shipped during the past year 3,500,000 pounds of cheese, valued at considerably above $1,000,000. Other shipments were nearly 1,000,000 pounds of butter and 40,000 cases of condensed milk.

MIDWEST UTILITOR

DEPENDABLE POWER — TRADE MARK

The Men Who Sell It Wanted to Know So They Used 4000 Acres to Find Out

Your protection in buying a Utilitor lies in the fact that this machine has been forced to prove its own dependability and usefulness before any man would attempt to sell it to you.

Long before we attempted to establish a selling organization for the Utilitor, we sent our engineers and agricultural experts over the country and told them to stay until they had proved beyond the shadow of a doubt that the Utilitor would perform satisfactorily under the conditions placed upon it.

They tried the Utilitor in all kinds of soil breaking, cultivating, seeding, truck garden work, nursery work, fruit cultivation and last but not least they conducted an exhaustive test of the Utilitor on belt work from running a grindstone to cutting wood.

We found that in certain parts of the country for field work special rims were necessary; in other parts of the country we found that guards on the machine to protect the plants were necessary. In fact we found many things to correct and several things that the Utilitor could not do, such as working on steep hill sides and in swampy lands.

But we proved above all else that with the adoption of the changes found necessary as a result of the many gruelling tests, that the Utilitor was unquestionably a power farming utility that would appeal to the practical farmer and food raiser as a cost-cutting, profit-building piece of machinery.

* * *

We then told the selling field that we were ready to do business with them. Now here is where all this begins to concern you.

These hard-headed keen merchandisers had no trouble in seeing the necessity for such a machine as the Utilitor, but they were not content to accept our word alone for what the Utilitor would do—how it would hold up—how well it would work.

They readily saw that the resources and experience of the Midwest Engine Company were behind every Utilitor in the form of the most comprehensive service system to owners which they had ever seen instituted.

Still they were not satisfied. They wanted to know first hand what the Utilitor would do in usage, because THEY were the men who had to show YOU what the Utilitor WOULD DO.

So they conducted their OWN tests. It has been estimated conservatively that the Utilitor has undergone tests in the hands of salesmen and dealers involving practically every possible use—some 4000 ACRES having been used to PROVE to these men that the Utilitor IS BUILT RIGHT, STAYS RIGHT and is applicable to the work for which it is intended.

What happened is this—the Utilitor sold itself to the men who would SELL IT TO YOU.

Can you ask for a better, a safer method of investigating the Utilitor than to KNOW FIRST that the man who sells it knows that it thoroughly lives up to the expectations of EVERY man who sells it.

But Regardless of All This, Here is What We Want You to Do When You Are Ready

Don't accept anybody's word for the Utilitor's performance but your OWN. Let all that we have told you simply be an incentive to want to know more about this machine for YOURSELF.

Any Utilitor dealer in your vicinity will give you a demonstration of the Utilitor doing the sort of work done on your place. You can rest assured that he will tell you very frankly if the Utilitor WON'T do your work. You will be under no obligation to buy a Utilitor if you are not completely satisfied with the Utilitor in every respect — mechanically, economically and otherwise.

If you don't know the Utilitor dealer in your locality, fill out the coupon and mail it to us and we will send you his name. We will be glad to send you any special information on the Utilitor which you may require.

Prices Named on Peaches and Figs

Manager Niswander of the California Peach Growers, Inc., in reporting naming of prices on peaches and figs, writes:

"The same benefits which were achieved for peach growers in obtaining higher prices it is purposed to obtain also for fig growers by coordination of the peach and fig growers in one large association. Immediately upon the announcement of the successful formation of the association, prices of peaches advanced and instead of three cents per pound, the price which prevailed for more than a year prior to organization, we are enabled to pay the grower an average price of six cents per pound the first year; that is, for the 1916 crop.

"For the 1917 crop we paid an average of 8.32 cents; for the 1918 crop an average of 11 cents, and for the 1919 crop an average of 14.52 cents.

"This advance from a starvation price to a fairly remunerative one was made possible only through the hearty cooperation of more than 80 per cent of the peach growers of the state, to whom we now appeal to continue the organization which saved the peach industry.

"The benefit to the grower was not alone in the advance in price from three cents per pound to 14½ cents, but during this period progress was made in standardizing your commodity and in establishing through international advertising the Blue Ribbon brand and by developing a mechanical device to remove the objectionable fuzz and peel from the peach; the device and the established brand being worth millions of dollars to the peach growers of California.

"All are familiar with the present deplorable condition of the fig market. Six months ago figs were commanding from 15 to 20 cents per pound. Today there are no buyers for figs at any price. This is a striking object lesson, when it is considered that prunes, apricots, raisins and peaches, being systematically and cooperatively handled by associations, remain firm at remunerative prices, while figs alone, not handled by growers associations, have declined from the high prices of a few months ago to a basis of less than cost of production.

"After thoroughly considering the fig situation, and at the earnest request of many fig growers, it has been decided by your board of directors and approved by your trustees, that this association undertake the receiving, packing and marketing of the fig crop. We feel confident that this information will be well received by every grower within the state, not only because of the unsettled condition of the fig market, hut because it is in harmony with the great cooperative movement so general at this time among the producers of the nation.

"We are entering upon the last year of the growers' contracts and in order that your board of directors may determine upon some points affecting the future policy of the association and in order to save a great deal of time and expense in securing the necessary acreage, it is thought advisable to go before the growers at this time and renew the peach contract at the time of signing up the fig acreage."

A Nevada County Pear Orchard

Scene on the land of the California Mountain Fruit Company four miles from Grass Valley. These are young trees just beginning to give promise of great production.

Prices Named

A minimum of five cents per pound for Yellow Freestone peaches, three cents per pound for Kadota and White Adriatic figs, four cents per pound for Calimyrna figs, two and one-half cents per pound for Black Mission figs, and such a minimum price per pound for White Freestone, Strawberry Freestone and Cling peaches as the board of directors shall direct before the first day of August of each year, are the prices set in contracts for 1921, 1922, 1923 and 1924 fig and peach crops.

Program for Citrus Institute

The directors of the California Citrus Institute announce the following program for their two day meeting June 24 and 25 at Santa Ana. In arranging this program emphasis has been laid upon the care of mature orange groves, including such things as pruning, cultural methods, and irrigation. A half day's session will be given to ranch labor problems. An attempt has been made in arranging the program to give ample time for discussing the various papers presented.

The meetings will all be held in the Elks Club Hall, including the informal banquet the evening of June 24.

While it is not essential that reservations be made for this banquet in advance, all who expect to attend it are requested to communicate with Orange County Farm Bureau, Santa Ana. The farm bureau is also desirous of aiding any from out of town who desire to reserve hotel accommodations for the night of the 24th.

The Program

Thursday, June 24, 9:30 a. m. Care of Mature Orange Groves: Results of Pruning, Fertilization and Soil Handling Methods on the Arlington Experimental Grove, Dr. H. J. Webber, Professor R. S. Vaile; Pruning Mature Orange Trees, Robert W. Hodgson, farm adviser, Los Angeles county; Methods of Applying Fertilizers, W. P. Kelley, citrus experiment station, Riverside.

2:00 p. m. Cultural Methods with Light Soils, H. F. Pressy, assistant manager Rancho Sespe, Sespe; Cultural Methods with Heavy Soils, I. G. McBeth, manager Leffingwell Rancho, Whittier; discussion by W. H. Fleet, manager Rancho Sespe, and R. S Thompson, Highland.

6:30 p. m. Informal banquet, Elks Club House, $1 per plate. Water Conservation, by W. S. Jones, Claremont.

Friday, June 25, 9:30 a. m. Irrigation: Duty of Water, Dr. L. D. Batchelor, citrus experiment station, Riverside; Irrigation Control Studies at Chula Vista, F. M. Eaton; Irrigation of Light Gravelly Soils, C. J. Booth, Chaffey Junior College of Agriculture, Ontario; Irrigation of Medium Loam Soils, J. D. Culbertson, assistant manager, Limoneira, Santa Paula.

2:00 p. m. Ranch Labor and Insect Pest Problems: Survey of Labor Situation, H. J. Ramsay or George B. Hodgkin, field department, California Fruit Growers Exchange; Labor for the Small Ranch, F. A. Pomeroy, man-

ager San Fernando Citrus Association, San Fernando; The Orange Tortrix, Professor H. J. Quayle, citrus experiment station, Riverside.

NEW PEACH GRADER

The U. S. department of agriculture reports that peach growers are displaying keen interest in the new peach sizing device perfected by the bureau of markets. Application for a public patent covering the sizer has been granted by the patent office, and many requests for drawings have been received.

The machines will be used in the peach belt during the coming season. The performance of the sizer will be carefully watched by peach growers and manufacturers generally, and if the device proves to be all that is claimed for it the next peach season will doubtless find a large number of the machines in practical operation.

The object sought by the use of the machine is to handle fruit more efficiently than heretofore and at lower cost. The over-all dimensions of the machine are 25 by 15 feet, and with from 10 to 15 packers working at one time, each machine permits a run of from two to three carloads a day. The device can be operated by an electric motor of less than one horsepower capacity, or by a small gas engine, and can be run at half capacity if desired. According to estimates of the designers, the machine should sell commercially at not more than $450.

It is thought that, in addition to sizing peaches, the machine has possibilities for grading fruits such as apples, pears and oranges. The device now is being tested for grading sweet potatoes.

PLANT PATHOLOGY CONGRESS

Porterville, through its chamber of commerce, has called a state plant pathology congress for June 25 and 26. Dr. P. A. Boncquet, county plant pathologist, whose investigations have been of great value to growers, will be in direct charge of the program. Addresses will be made by state and county horticultural experts and by practical growers of all kinds of fruits and vegetables. Because of the great diversity of production within a few miles of this city, opportunity is offered for a wide range of field demonstrations in the various sections into which the congress is to be divided. Invitations are being sent to chambers of commerce in all the producing sections of the state and provision will be made for caring for several hundred visitors.

WAGE FOR WOMEN WORKERS IN CANNERIES

A rise in the minimum wage of the 20,000 women employed in the fruit and vegetable packing industries of the state from $13.50 to $16 a week, effective July 24, has been ordered by the state industrial welfare commission.

An apprenticeship period of two weeks was ordered for beginners, during which they shall be paid $12 a week, a rise of $2.

A strict eight hour day was ordered for the packers of dried fruit and raisins, but the green fruit and vegetable packers will be permitted to allow overtime. In this event they must pay a "rate and one-half" wage for all extra work.

OFFICE OF STANDARDIZATION

Under the state department of agriculture Fred W. Read has taken charge of the office of standardization, with headquarters at Sacramento. He will have two assistants, both of whom will be experts in their line. It is thought one will be an apple specialist, with headquarters at Watsonville. The other may be sent south; full plans are not yet complete. The state and federal officials have a reciprocal agreement whereby state inspectors are also federal inspectors and their certificates of inspection will be accepted in other states. California officials have agreed, so far as their influence extends, not to have present state standardization laws changed without consulting the federal officials.

POISON BAIT FOR CUTWORMS

To control cutworms use poison bran bait. It is made by mixing 2 pounds of powdered white arsenic or Paris green, 50 pounds of bran and 3 finely chopped lemons. Moisten this with about 7 gallons of water sweetened with 2 to 4 quarts of low grade molasses. Sow this broadcast late in the evening over infested fields. Use it sparingly, as it does not take much to do the work. For a small truck patch prepare only a few pounds of the bait. It is the same bait used for grasshoppers and army worms. The pest is attracted to the flavored bait and will feed on it in preference to the crop. The arsenic serves as a stomach poison, quickly killing the worms. Do not wait until the damage is done but prepare and apply it before or just as the corn begins to come up.

CHERRY DAY

Southern California's cherry producing sections are very limited; in fact, the only production is in San Bernardino and Riverside Counties in the neighborhood of San Gorgonio Pass. Beaumont is announcing observation of Cherry Day in order to call attention to her great cherry growing possibilities. The day is to be observed Saturday of this week. There will be band concerts, ball games and sports during the afternoon, with ball in the evening.

Beaumont grows many varieties of cherries, but the chief ones are the Black Tartarian, Royal Ann, Bing and Lambert. The trees commence to bear when about six years old and at seven they begin to be profitable. The average yield of a tree eight years old is about 150 pounds.

NURSERYMEN TO MEET

The tenth annual convention of the California Association of Nurserymen will be held in Fresno, November 11, 12 and 13, 1920.

A program of unusual interest to nurserymen, fruit growers, seedsmen and florists will be provided, discussing such vital topics as certified bud selection from record bearing fruit trees, cooperation and collective action, plant production and the federal quarantine, California nurserymen of the fifth decade.

DRY RUBY BLOODS

In a citrus plantation near Corona, A. D. Shamel observed on a Ruby Blood orange plant (Citrus sinensis) a branch differing distinctly from all the others by its narrow, long shaped leaves, and still more by its thick rinded fruit (almost double the normal rind) and pulp which was not red and juicy, but straw colored and quite dry. All the 76 fruits borne by this branch had the same characters. It was obviously a case of bud variation (bud mutation).

Closer examination immediately showed the existence of not only over 100 of these mutation branches, but even of whole trees belonging to the dry type. On both the mutation branches and trees there were always found, together with a small number of contingently normal fruits of a mixed type, a large number of dry fruits which, at first sight, could not be distinguished from the others, so that they might be sent to market and cause the producer unjustly to be blamed. It is, therefore, necessary to choose grafting material with greater care and to take it only from plants which have been carefully observed each year. The haphazard taking of grafting material has done much to propagate these bud variations as well as other commercially useless ones.

Place Your Order NOW for Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure.

Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

Ask for prices, delivery from warehouse, Los Angeles and San Francisco, or ex steamer to arrive.

The Miskin Scraper

IS

THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars

The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market.

Made in 2-horse, 3-horse and 4-horse sizes. The four horse size can be operated by small tractors from the tractor seat, by the tractor driver.

Send for descriptive circulars, with prices. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.
Maintain a moist surface mulch.
Will prevent June drop.
Require less irrigation than other crops.
Need no irrigation where soil moisture has been conserved.
Build up poor soils with more nitrogen bacteria and humus than any other covercrop.
Afford the best kind of pasture for cattle and hogs.
As a hay have a food value of 43% more than Alfalfa.
Will improve your silage.
There is no better Bee Pasture.
Thirty pounds of seed is sufficient to plant one acre.
Our seed germinated 96%.

South Africa's Citrus Industry

THE South African Journal of Industries recently contained an interesting discussion of the progress of fruit growing in the Union and the development of an export trade, with special reference to citrus fruits. Extracts from this article are quoted below:

The production of citrus fruits in South Africa was in the past confined to comparatively small areas and the annual income derived therefrom a matter of small moment. There was no inducement to plant large numbers of orange and lemon trees, because the total white population of the country was small and the demand limited. As soon as it was demonstrated that oranges could be successfully exported to the European markets the matter assumed another aspect, and it was gradually realized that here was a business which could be exploited to an almost unlimited extent.

Just as South African deciduous fruits arrive in Europe at that season of the year when the market there is bare and there is no competition, so do the citrus fruits arrive when the supply from Europe and North America has ceased, and South Africa has almost a monopoly of the orange business from June until October. This means that it is now possible to obtain in Europe South African citrus fruit of all kinds just at that period of the year when they are most appreciated and are most beneficial from a health point of view.

Export of Oranges

Oranges are grown principally in the Transvaal, Cape Province and Natal. Very few groves exist in the Orange Free State, its name notwithstanding, and from a commercial point of view these are negligible. The area of land suitable for citrus fruit is more extensive in South Africa than that on which any other fruit will thrive, and for this reason it will be readily seen that the orange will be the leading export fruit within a few years. The suitability of vast tracts of land in the Transvaal and Cape Province to the growth of the orange is demonstrated in the thrifty appearance of an occasional tree planted where there happens to be a little water available.

The exportation of citrus fruit commenced in a small way in 1907, since which time considerable though not uninterrupted progress has been made. Each of the three producing provinces is represented in the export figures. Very little difference occurs in the numbers shipped from the Transvaal and those from Cape Province. At one time the bulk of the citrus fruit exported from South Africa was grown in the Transvaal, then the Cape took a slight lead; now indications point to an increase in the Transvaal production.

Inspectors at ports and local shippers estimate the quantity of citrus fruits available for export in 1920 at 16,054 cases.

The varieties of oranges for export have in the past consisted of the ordinary seedling of the country, with perhaps half a dozen of what may be termed "popular standard varieties." About 75 per cent of the total have been seedlings. Future plantings, and consequently exports also, will undoubtedly, as has been the case in California, consist of standard kinds, and the favorites will be Washington Navel, Valencia Late, St. Michaels, Joppa, Jaffa, Mediterranean Sweet and Malta Blood, in approximately the order named.

Other Citrus Fruits

The demand for grapefruit is larger in America than in any other country. As South Africa has not hitherto grown any to speak of, the Union has not been able to tap this most profitable market. The few hundred boxes that have been exported from South Africa have been sent to London, where the demand is also good and prices equally so for the right article.

As an export fruit, the lemon has not hitherto proved a success. This is attributable to the simple facts that in the first place over-sea prices are too low to appeal to South African growers, and in the second, the supply of Mediterranean lemons is so large and the handling of the crop so economically done that there are few months out of the twelve during which the South African article has any opportunity of striking anything but a full market. During July and August lemons in London are a fair price, and although not so high as here, should later on appeal to the South African lemon man. At that time of year the local demand, owing to low temperatures, is slack, whilst in Europe the weather is hot and may also be described as "thirsty"—in fact, just right for lemon drinks.

The Seville orange, known the world over as the Bitter Seville, is the one orange which is preferred for marmalade. No other kind makes such a beautifully clear product, and although in California great efforts are being put forth to create a demand for marmalade made from the Washington Navel orange, the choicest marmalade is and will continue to be made from this fruit. The local demand for this fruit has been very small until the last few years, when a demand has arisen for better class marmalade, with the result that the Seville was more in demand. Possibly there are not more than 5,000 Seville orange trees in South Africa today and they are not worth planting to any extent, although good prices should be obtained for some years to come. The trouble is that the Spanish product is available in such huge quantities and at such low figures that prices are forced down below the limit which South African growers regard as profitable.

* * *

Regarding the Bitter Seville, often called in California the Florida Sour Orange, it is used to an extent in this country in the manufacture of marmalade, but the American taste has not taken to the bitter marmalade as has the European. Here even the bitter of the Navel, Valencia or other sweet orange is partially eliminated in order to give the flavor most preferred by the American consumer. The trade takes to this sweeter product, as is shown by great increase in the manufacture of California marmalade.—(Editor.)

APRICOT PACK DISCUSSED

Standardization of fresh shipping apricots was discussed at a meeting held recently by Director Hecke of the California department of agriculture to consider the advisability of special rulings in view of the serious infection of shot hole fungus. A number of growers in the affected districts met with the director of agriculture and the county horticultural commissioners, and it developed as practically the unanimous opinion that the standards as laid down in the existing law should not be changed.

There was some discussion as to whether or not a separate standard for apricots shipped in lug boxes should be considered, but it was brought out that such a change in the standards would result in irreparable loss or prestige for a pack which is just developing in popularity in eastern markets. It was felt that under any consideration the lug box pack should be equal in every respect in regard to quality of fruit to the crate pack.

After a very thorough hearing Director Hecke ruled that it was undesirable to lower in any way the standards as defined in the present law. This ruling met with the unanimous approval of the county horticultural commissioners from the counties affected. It is therefore understood that in the coming shipping season not over three per c nt of shot hole fungus will be allowed in any shipment of apricots.

PEACH LEAF CURL

In the peach orchard of J. C. Craig Owensmouth, the trees were sprayed in November for peach blight and shot hole fungus. In March all but one row was sprayed with Bordeaux for twig borer and curly leaf. The main orchard is nearly free from curl and the ground beneath clean. On the unsprayed trees there is much leaf curl still in evidence, though the disease has about run its course as it attacks only the earliest foliage. But the ground beneath is littered with dead curled leaves and some small peaches. As these diseased leaves were killed

when the trees had few and needed many it is easy to see how the vitality was lowered. This object lesson was an enlightenment to a small crowd of investigating growers who visited the orchard with Dr. Whitten and Assistant Farm Adviser Blanchard.

TREATMENT FOR CROWN GALL

Crown gall (usually called root knot by fruit growers) is one of the most serious diseases of deciduous fruit trees.

Nursery stock must be inspected with great care before planting and all infected trees rejected. Cutting the galls from the roots does not prevent the recurrence of the trouble when the trees are older. Orchard trees should be examined at the crown for the appearance of the growth or gall, which will eventually girdle and kill the tree if neglected. For treatment of orchard trees, Prof. Ralph E. Smith writes:

"The best thing to be done in the case of crown gall which you describe is to get the dirt away from the trunks down to the main roots, cut out all diseased growth as cleanly as possible and cover the exposed surfaces with Bordeaux paste. One time is as good as another for this work and there is nothing else which can be suggested.

"The following is the formula for Bordeaux paste as recommended by Professor Fawcett:

"One pound of bluestone (copper sulphate) dissolved in one gallon of water in a wooden or earthen vessel. This can best be done by hanging it in a sack in the top of the water. Two pounds of unslaked lime, slaked in about one-half gallon of water. Some variation from these proportions may be made without greatly changing the value of the paste. Stir the two solutions together when cool, making a light blue mixture about the consistency of whitewash. After applying the paste for crown gall I would not replace the dirt, but leave the cavity open until it gradually works in again."

A single cleaning out of the crown gall is not always sufficient. After a period of active growth has elapsed the wounds should be carefully inspected, and wherever any galls are appearing these should be dug out thoroughly, making a smooth, clean job, applying the Bordeaux paste again.—H. P. Stabler, Horticultural Commissioner, Sutter County.

DATES IN ALGERIA

The chief industries of the south territories are livestock, date culture, and raising of wheat and barley. Date culture constitutes the basis of agricultural production in the Sahara. The date is the principal foodstuff of the natives and an important article of commerce. The number of date palms in the south territories in 1918 was 5,758,537.

These figures show very slight increases over the preceding years, as war conditions were not favorable to extending plantations. However, the very high prices which dates brought in 1917, and particularly in 1918, when prices were five times as great as before the war, stimulated the effort to increase the existing areas and to create new plantations in Oued Rhir, the economic center of which region is Touggourt. Difficulty in the extension of this culture is caused by the lack of "djebars" or offshoots, the available supply of which has been insufficient for several years. Offshoots in 1914 cost 3.50 francs (about 87½ cents) and have since tripled in price. By a decree of December 31, 1915, the exportation of offshoots from Algeria was prohibited. The export of dates for 1918 was 2,030 tons.

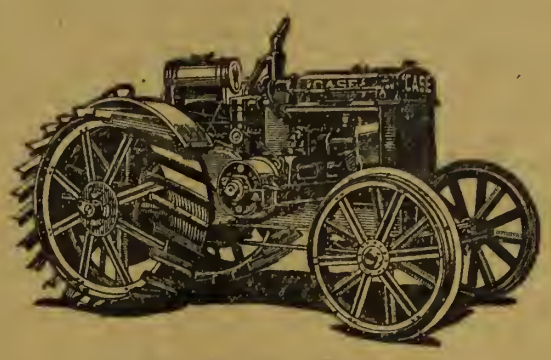
THE LADY APPLE

By Joe Hooper.

At Coloma, where gold was discovered in 1848 and which has been shipping peaches to New York for over 60 years, the farmers are raising a new kind of apple called the Lady Apple which seems to reach perfection only in that locality.

The trees are secured from grafting the Lady Apple onto the large apple trees which have stood in the Coloma Valley since they were planted in 1850. The small seedlings can also be grafted. The trees grow to an immense height and it requires a 20 foot ladder to pick the fruit from some of them, and even then the limbs are ten feet higher. No trimming is

Why Case Kerosene Tractors Are Dependable



Case 22-40 Kerosene Tractor

Case 15-27 Kerosene Tractor

Case 10-18 Kerosene Tractor

Look for the EAGLE Our Trade Mark

To avoid confusion, the J. I. CASE THRESHING MACHINE COMPANY desires to have it known that it is not now and never has been interested in, or in any way connected or affiliated with the J. I. Case Plow Works, or the Wallis Tractor Company, or the J. I. Case Plow Works Co.

THE factories of the J. I. Case Threshing Machine Company were founded in 1842. From the little one-man shop where the first Case Threshing Machine was made, there has grown the great plant of today in which Case Kerosene Tractors and other Power Farming Machinery are designed and built.

This great factory covering more than 140 acres of ground and employing more than 4,000 experienced workers is your assurance that every Case Kerosene Tractor must be capable of making good.

For 79 years this plant has consistently and continuously grown. During all these years our reputation for building high grade farm machinery has grown with and beyond the factory until today the good old trade mark of the Eagle on the Globe is a recognized sign of excellence on Case machinery in every civilized country in the world.

Remember that we are as eager to *build* the best tractor as you are eager to *buy* the best tractor; and we are confident that no better tractor can be built or bought than the Case Kerosene Tractor.

Write for catalogs showing why the Case Kerosene Tractor is best for you to buy.

done and the limbs grow like the willow or weeping willow tree. The fruit hangs in clusters on these limbs and they bend almost to the ground. When the trees are in blossom they resemble an immense rosebush and are a beautiful sight.

The Lady Apple is a small apple with with red cheeks, varying in size from one-quarter to two inches in diameter. When the trees are loaded with these apples they resemble the rosebush, the same as when in blossom. The apples are very firm and keep all winter. They are picked in November.

Spraying

The trees have to be sprayed at least three times each summer to control the codling moth, as this moth is very prolific due to the large number of apples on the trees.

The Market

San Francisco has bought all the apples the Coloma farmers have been able to raise so far. The output last year was 800 pear boxes, and these were all used in San Francisco or shipped to Honolulu which market uses many of them. These apples are packed one tier ten across on the top of the box and the balance filled in. When the boxes are opened they are in perfect condition for window display. These apples resemble the Christmas red candy and most of the fruit is used for this purpose, most of the apples reaching San Francisco for the Thanksgiving and Christmas trade.

Record Tree

One Coloma tree yielded 65 lugs at picking last year. This is an especially large tree, the trunk being over 12 inches in diameter and 35 feet high, but a number of the other trees have produced 40 to 50 lugs. The trees generally bear every other year, but these apples help to reduce losses on farming due to the severity of the climate on the Coloma peach crops.

Sunburn and Wood Decay

By Robert W. Hodgson

CALIFORNIA is preeminently great in the production of fruit and in many ways is her supremacy along this line shown; wealth returned from fruit crops, acreage devoted to orchards, number of persons engaged in fruit growing, extreme diversity of fruits grown, as well as in other ways. With the olive, the almond, the wainut, the apricot, and perhaps others of minor importance, this greatness amounts to virtually a monopoly, while with the more common sorts such as the peach, pear, plum and apple, her production constitutes an important part of that of the nation at large. The high position occupied by California among fruit producing districts of the world might naturally lead one to assume that such might be due to her growers having solved all their problems. But while California's reputation as a progressive fruit growing district is second to none in the world, her preeminence in this regard is not due to this reason. By no means have all the problems of fruit culture in this state been solved. Indeed, to those best qualified to judge it is apparent that we have but begun to recognize some of the major problems, not to mention solving them. California's greatness as a fruit growing state is not due in any great measure to superior knowledge; it comes as a result of our matchless and unrivalled growing season climate conditions, a gift of the gods, for which we can claim no responsibility whatever. Being so greatly favored by nature, California fruit growers should the more earnestly press toward the solution of these problems.

Among the most important of these may be considered the causes for the decline of the older orchards. On every hand are to be found evidences of deterioration in what were once prized orchards. The older prune orchards of the Santa Clara Valley are going back year after year. Many of the finest peach and cherry plantings in the state have been pulled out within recent years on account of their becoming unprofitable. Many of the older citrus groves are going back noticeably. And yet the remarkable and perhaps significant feature is that not all of the older orchards are doing so and in particular isolated trees favorably situated. Some of the original Sutter County peach trees from which came many of the great commercial orchards of the state are still standing and bearing big crops of fruit while the younger orchards are going to pieces. Splendid old cherry and prune trees are still to be found in the Vaca Valley and the Chico district, while patriarch citrus trees are by no means uncommon.

We know of no inherent fundamental reason why our commercial orchards should not last longer. Individual cases by the score can be adduced to show that there is no necessity for early decline. The old statement, "Fifteen years is the bearing period for the peach," so often quoted by commercial growers, is belied by the many fine old peach trees scattered about the state. One cannot but be led to conclude that in the care given the orchards lies much of the reason for early wearing out. And such we find to be the case.

Authorities now agree that sunburn and wood decay annually kill more trees in California than all other causes combined, and that these two troubles account for most of the early decline found in our commercial orchards. And the encouraging feature is that both of these difficulties can be very largely prevented by orchardists if they but care to.

Sunburn

The wondrously clear California atmosphere permits an abnormally large per cent of the sun's rays to reach the earth, including those most inimical to unprotected living substance. These are the rays supposed to produce much of the sunburn so prevalent on unprotected trees in this state. In the past we have been led to believe that sunburn occurred mostly during the hot growing season when day temperatures run high. We now know, however, that such is not the case. At this time of year the temperature within the trunk of the tree is apt to be somewhat lower than atmospheric temperature, on account of the tremendous evaporation. It is during the dormant period in the winter that the greatest injury occurs. At this season of the year the trunks are bare and unprotected by foliage and not cooled by evaporation. The sap is not in movement and the tree is in no way protected against the high temperatures which so frequently occur during clear winter days. The result is that the temperature inside a tree trunk on a bright winter day may be considerably higher than atmospheric temperature. Activity is started in the cells so heated and checked at night when the temperature falls. This alternate retardation and stimulation, with possible frost injury to the active tissue, starts the greater part of the cases of sunburn.

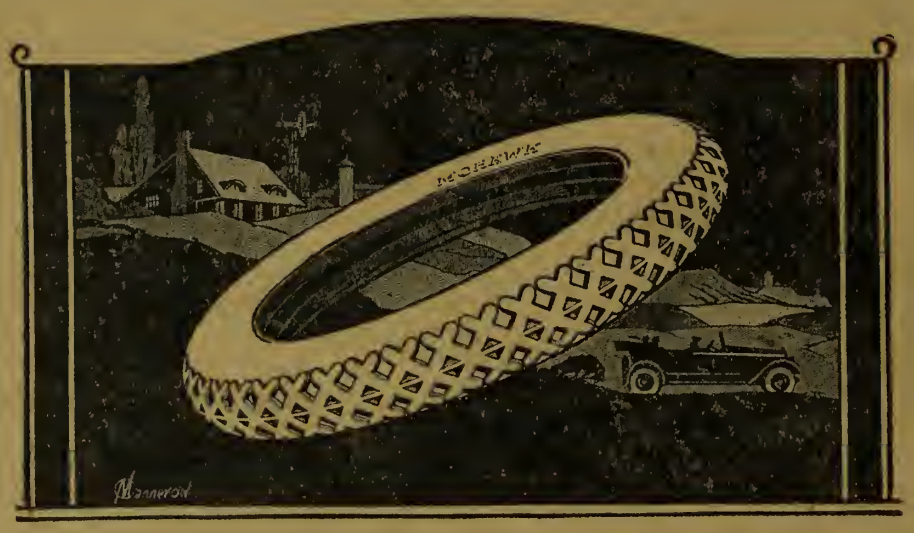
The cure for sunburn lies in prevention by means of tree protection. The best method for accomplishing this is through whitewashing, although tree protectors, either paper or yucca, are material aids. Trees should be kept whitewashed all the year round, starting in at the time they are set and continuing throughout their lifetime. Many different formulas for whitewash have been used with good success, but two of the best are as follows:

California tree whitewash—Quicklime 30 pounds, tallow 4 pounds, salt 5 pounds.

University formula—7 pounds unslaked lime, 2 pounds powdered sulphur, and 1 pound salt. Slake all together, the heat generated incurring a chemical reaction which makes the whitewash stick.

Wood Decay

Wood decay is caused by a half



How To Choose Quality Tires

The tire buyer has no means of examining the inner part of a tire, upon which the mileage really depends.

Cross sections of a tire are no proof. Rubber substitutes may look like pure rubber.

Experimenting with various kinds of brands may prove which is the best; but this is an expensive and troublesome method.

To know positively the kind of materials and workmanship which go into a tire—this is the safest method of choosing.

Good mileage isn't accidental. It depends entirely upon the honesty and sincerity of the manufacturer, in using such pure rubber, such strong fabric, and such experienced workmanship that his products consistently stay well above the quality line which divides good tires from poor tires.

The best proof of how consistently the Mohawk Company has kept faith with the users of its product throughout the entire seven years of its history is shown by the number of permanent Mohawk users. Actual records kept by Mohawk dealers show that 85 per cent of all motorists who buy their first Mohawks use Mohawks exclusively thereafter.

Certainly this is proof of Mohawk quality of materials and workmanship which cannot be denied.

Made in Cord and Fabric Types—good dealers everywhere handle them

dozen or so different genera of fungi which gain access to the tree through the medium of wounds made through sunburn, accidental scarring of trees in cultivation, severe pruning, or by the wind, and find lodgment in cracks or crevices in these wounds where they start growth. Once established they grow down through the heartwood, progressing in many cases clear down into the roots before the tree dies. The injury done to the tree lies in the absorption of the poisonous compounds given off by the decaying wood which causes the tree to finally die of toxic compounds. Wood decay may be almost entirely prevented by treating all wounds of an inch or greater diameter with a good wound dressing. The important thing is that the wound must be protected until it has healed over, which sometimes means several years. Many materials have been used in the past, including white lead paint, whitewash, shellac and others, but only one general class of substances seems satisfactory, that with an asphaltum base. Beeswax-rosin grafting wax is excellent but somewhat expensive. Ordinary asphaltum roofing paint has been used with good results. Grade D asphaltum heated and applied hot, is good. The same material dissolved in benzine or gasoline makes a good dressing. Grade B asphaltum, a liquid form, is also good. Several commercial preparations are on the market. With all of these however, large wounds at least must be followed up and retreated from year to year. With proper attention to whitewashing and treating wounds, there is no doubt but that much can be done to prevent decline in old orchards.

Undoubtedly a contributing factor in many cases is the burning out of the organic matter in the soil. While the evidence supporting the use of commercial and mineral fertilizers especially is entirely too fragmentary and conflicting for much reliance, everything points most conclusively toward the use of organic matter being followed by an excellent response on the part of deciduous fruit trees. The growing of cover crops therefore, as well as the application of manure, is to be advised as a practice calculated to materially improve the fertility of our orchard soils and thereby to prevent decline occasioned by exhausted organic matter.

U. S. DEPARTMENT REPORTS NECESSARY STEPS TO PREVENT BOTULINUS

The bureau of chemistry of the department of agriculture authorizes the statement that it has met with a gratifying degree of cooperation on the part of packers of ripe olives in improving methods to such an extent that danger from botulinus poisoning in future packs will be eliminated. Five groups of deaths traced to poison produced by the organism known as bacillus botulinus have occurred in New York City, Detroit, Michigan, Canton, Ohio, Memphis, Tennessee and Kalispell, Montana.

Very extensive investigations have been made by scientists from the bureau of chemistry with the cooperation of the packers, and the packers have also employed specialists to study the causes of botulinus poisoning and the precautions which should be employed to prevent further diffculty. The experts agree that the trouble is not inherent in the type of container used. Whether the olives be packed in glass jars or in tin cans they may be rendered absolutely safe if proper precautions are taken to prevent the infection with bacteria during handling and if the packages when filled are sterilized at a sufficient temperature and for a sufficient period of time. It is entirely practicable, say the specialists, to sterilize both glass containers and tin cans at a temperature high enough to insure absolute sterilization.

Lack of Precaution Responsible

Unfortunately some packs of ripe olives put up in glass as well as some in tin during past seasons were not prepared with all the precautions now known to be essential and were not sterilized at a sufficiently high temperature, and some of these goods in glass were responsible for the fatalities. It is probable that of all the ripe olives on the market but an extremely small number actually contained bacillus botulinus. Of more than 2,000 individual packages collected and examined in the bureau of chemistry but eight were found to contain bacillus botulinus, and seven of these were from the output of one manufacturer and from one batch of his output. In addition to these eight, the bureau has examined samples of some of the olives responsible for the fatalities and has also found bacillus botulinus in these specimens. There is no reason to anticipate danger from properly packed and processed ripe olives whether they be packed in tin or glass containers.

CLAREMONT POMOLOGICAL CLUB

The Claremont Pomological Club held its annual meeting at Claremont on Saturday, May 29. Mr. and Mrs. Pierson of La Verne were the hosts.

After the regular business the officers for the coming year were elected as follows: Chas. E. Needham of Glendora, president; Joseph S. Pierson of La Verne, vice-president; Mrs. W. O. Fritz of Pomona, treasurer; V. V. LeRoy of Los Angeles, secretary.

It was voted that the regular picnic meeting be held in conjunction withthe summer state citrus institute at Santa Ana on Thursday, June 24.

The first address was by Mrs. J. E. Hazzard of the Los Angeles County farm bureau on economic buying. In it she showed that much of the H. C. L. was the fault of ignorant buying Much that we buy is badly adulterated. In ten samples of taffeta silk obtained in our stores not one was of silk but of preparations of wood fiber. Out of 13 samples of other silks only three were real silk. Some had a few threads of silk, with prepared cotton. Some merchants are trying to have their clerks sell goods for what they are, but the clerks in most cases are as ignorant as the customers. You can't tell by prices any more. Expensive articles are not necessarily good or true to name. The telephone is an ahomination in buying and the greatest help to palming off any old thing on the person who orders with it. Don't object to high costs, if you insist on having a spool of thread delivered; a customer of a big city store did this last week. Never buy a table cloth or napkins for linen unles you test them.

Dr. J. G. Biller gave the first paper of the afternoon, on the citrus blast, which is doing much damage in the north. It is a bacterial disease, attacking the outer limbs of the trees until they resemble badly frozen orchards. The state and county horticultural commissioners are on the lookout to keep it from the south, where it would probably spread much faster. It requires both heat and moisture to make it active.

Prof. R. S. Vaile gave the last of a series of addresses on fertilization. He summarized his lecture as follows: Organic matter must be incorporated in the soil as deeply as possible. There is no probability of getting too much organic matter, even if you use barnyard manure also.

Summer cover crops are of doubtful value unless one has abundance of water and uses it.

The fertilizers must be placed as deep in the soil as possible. Most of the commercial fertilizers are drilled in and seldom go down to the root area. Cover crops should be plowed in as deeply as possible. Plowing is of little value except to get fertilizer deep into the soil. Cover crops become available when turned under green in about six weeks.

Never let your orchard get dry. It takes a long time for water to go any depth in dry soil, but if moist it will go down quickly. Dust mulch by numerous experiments in Utah and other states has been shown to be of little value in conserving moisture, but we must cultivate well in order to get our furrows deep enough to put the water where it should be. Don't try to cover your furrows too soon. Much harm is being done to the soil by working it too soon. Leaving the furrows open for several days will do no harm. Of course, the kind of soil must be considered, but don't think you are losing much water by not covering in at once.

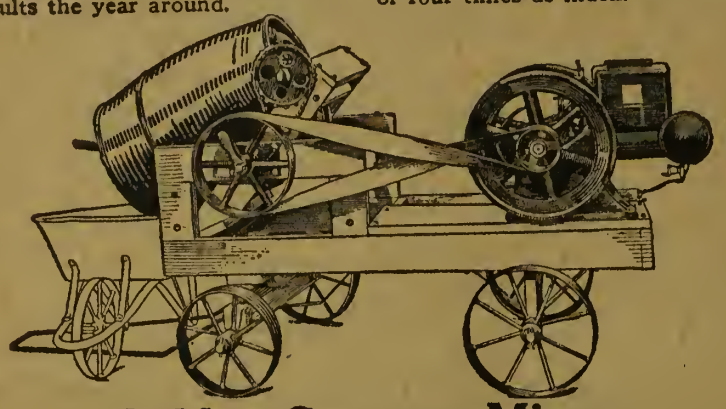
A Concrete Mixer At Every Man's Price

We consider ourselves very fortunate in securing the exclusive agency in this part of the country for the Sheldon Concrete Mixer. It fills an old need of the contractor and farmer; that of a reliable low-priced mixer that will give perfect results the year around.

The price of the Sheldon Concrete Mixer puts it within reach of every man. In fact, it costs so little that it soon saves its cost in labor saved alone. And the work it turns out would do credit to mixers costing three or four times as much.



Sheldon Concrete Mixers

In this day every farmer and contractor is looking for an economical, labor-saving method of putting in concrete. The Sheldon fills the bill. Farmers and contractors all over the United States—thousands of them—are using the Sheldon and getting perfect results.

The Sheldon is a sturdy machine, built exclusively for the man who does not want to invest a lot of money in a mixer.

However, when a big job comes along, the Sheldon will handle it. It will mix a batch of concrete in from one to two minutes—some users have written us that they have mixed as high as five yards an hour. That is enough concrete to take care of almost any job.

But on small jobs one man can run it and turn out just as satisfactory work as when he is using a whole crew.

Call on us and let us show you the Sheldon—or write us and we will send you a catalog describing every detail of the different models.

EVOLUTION OF LONG STAPLE COTTON

(Continued from Cover Page)

not an over abundance of enthusiasm regarding this new crop. Governor Campbell said recently, "I will confess that I was not enough of a prophet twenty, or even ten, years ago to foresee the wonderful development of this locality. If I had been any sort of a prophet it would have been better for my bank account, though I am now ready to agree that the progress of the future very likely will be even greater than has been that of the past. Last season the cotton crop of the Salt River Valley alone would have paid the cost of two reclamation systems such as that which supplies it."

The success of the cotton growers was such this first year that more were anxious to try it the next. The acreage increased up to 1915. This was the year following the outbreak of the big war and cotton prices had dropped to a low level, but in the fall of 1915 prices again advanced and the acreage has been steadily increasing.

L. M. Harrison, field agent of the United States bureau of crop estimates, in his report for May 8 of this year says:

"Cotton prospects on May 1 were not very encouraging, due to the late season. While much replanting has been necessary, the crop shows about an 80 per cent stand with the condition rapidly improving as a result of more favorable weather. A preliminary estimate places the acreage of the American-Egyptian variety at 210,000 acres, which comparies with 87,000 acres one year ago, 72,000 acres two years ago, and 33,000 acres three years ago. Maricopa County reports 185,000 acres; Yuma, 13,000; Pinal, 10,000; and Pima, 5,000. The state acreage of short staple is estimated at 20,000."

Along with the increased acreage has come an increased price per pound, which is due in part to the general uplift of the cost of all commodities and also to the increased uses for the long staple cotton. Chief of these new uses is that of the fabric and cords for automobile tires. It is true that during the war the government found it could utilize the long staple cotton for making balloon fabric and also a cloth for aeroplane wings. Another use, recently developed, is for covering for insulated electric wiring, supplanting Irish linen.

Considering the demand for automobile tires and the other goods for which long staple cotton is used, such as thread, mercerized goods and some of the finer knit goods, it is not strange that the price has increased, especially when we consider that the acreage suitable for the production of long staple cotton in America is small as compared with Egypt. Our importation of Egyptian cotton is far in excess of its production in America, and the demands for long staple in England are such as would make possible the utilization of practically the entire product of Egypt, in fact, Great Britain's mills are sending out experts, hoping to develop new areas in Egypt. Africa and India where long or short staple cotton may be grown successfully. It will be, however, many years before any new areas can be brought into cultivation to successfully compete with America and Egypt as cotton growing sections.

The inroads of the boll weevil upon the Sca Island cotton, which was the only competitor of the American Egyptian long staple cotton, have wiped out this variety of cotton. There is a marked effort to increase the acreage throughout the Southwest. This year the acreage of long staple cotton has more than doubled that of last year in the Salt River Valley.

The increase of long staple cotton in the Yuma Valley over last year is considerable. There are also several other sections of Arizona where long staple is being grown to a considerable extent. In the Casa Grande Valley there is quite an acreage in the vicinity of Tucson. About 25,000 acres is being grown across the Colorado River in the Imperial Valley, some also in the San Joaquin Valley and some in the vicinity of Blythe. There is also a little cotton being grown in the Parker district on the Arizona side of the Colorado from Blythe, with a prospect that as more land is developed the acreage will increase considerably next year.

The average yield of long staple has been about one-half bale to the acre. It is quite probable that the late spring, which necessitated replanting and, where replanting was not general, has in some instances resulted in a poor stand, and that the yield this year will be slightly less than last year. This, of course, depends very largely upon the season, and the harvest may disclose the fact that the average of the past few years has been maintained.

Cotton has sold recently for $1.25 to $1.50 a pound. As to the probable price for the next five years I do not care to make any prophecy other than this, that the area of land which can produce long staple cotton is limited so that production is not likely to increase very materially. The uses of long staple are increasing much more rapidly than its production, so that regardless of whether other commodities are lower in price or not, cotton, and especially long staple cotton, should remain relatively high, although we are not optimistic enough to expect the price which prevails at present of from $1 to $1.50 a pound to obtain for an indefinite period. Yields as high as one and one-half bales have been obtained by a few growers. A bale to the acre is not particularly uncommon. Generally the better yields have been obtained upon land which has been in alfalfa and has thus been built up to a high state of fertility with an abundance of humus, although probably the best yields have been obtained upon fields which had been in alfalfa for about two years previous. An excess amount of humus frequently has a tendency to produce extensive vegetative growth rather than fruit.

There is still some discussion of the question whether or not the plants should be spaced close together or left two feet or so apart. Generally speaking, the successful growers are agreed that the rows four feet apart and plants 12 to 18 inches is about right. Some growers have been successful in planting two rows and leaving one row vacant, planting this later to cow peas, the primary object of this method being to introduce nitrogen and humus into the soil by the chopping into the soil of these cow peas when they were about to make seed. This has been said to result in an increased yield, but it is questionable whether the increased yield was not due to the wider spacing which permitted the sun to get into the base of the plants. If this theory is correct then the poorer stand which is characteristic of this season, theoretically, should not result in a greatly decreased yield.

There is also a little difference in opinion regarding the time and method of irrigation. Generally the best growers are quite well agreed that it is better to hold off the water until about the time the plants begin to blossom and then supply it only as the condition of the plant indicates the need. This is determined by the wilting of the plants during the early part of the day; as long as the plants do not wilt until late in the afternoon it is assumed that water is not needed. Practically all growers are agreed that success in cotton growing calls for the most careful preparation of the land. It must be plowed (and many insist upon cross-plowing), harrowed and made as nearly level as the slope of the land will permit, then the land saturated thoroughly with water and seed planted about one to one and one half inches deep.

To handle this acreage in cotton requires an enormous amount of labor and were it not for the fact that Mexican labor has been easily obtained it would not have been possible to produce this crop. It is estimated that the labor requirements for harvesting the present season's crop will be between 15,000 and 20,000 people.

The southwestern country where long staple cotton is grown, including all of Arizona and California, is peculiarly fortunate in having had no serious insect enemies. Owing to the isolated condition of the Salt River Valley and some of the other sections where cotton is grown, quarantine regulations are more successful, and it is hoped that they will continue to be successful in keeping out the pink boll worm and the Mexican boll weevil. It is not believed that the boll weevil in the dry climates would be as serious a menace as it is in the more humid sections; nevertheless every effort is being made to keep i

out. The pink bollworm would be a more serious matter, but with the quarantine regulations as they exist there is a reasonable assumption that we may be spared the affliction of this insect enemy.

There is every reason to believe that the long staple cotton industry is permanent, although it is probable that the acreage in the Salt River Valley is as large or larger this season than it ever will be again, as in order to grow this successfully it will be necessary to practice a rotation of crops and we expect to see some little of the acreage now in cotton plowed up this fall and planted to alfalfa. Diversification of crops and a rotation which will bring in alfalfa are absolutely essential to maintaining the permanent success of this industry.

One of the factors which has contributed no little to the success of the cotton growing industry has been the thorough manner of seed selection. The difficulty which Egyptian growers have experienced has been the deterioration of the several varieties grown. It has been found difficult in Egypt to select in such a manner as to increase the quality, while just the reverse has been true in the Salt River Valley. Under the direction of government experts, fields of cotton have been planted with the best of selected seed. These fields have then been grown and the seed saved for planting selected areas.

Inasmuch as no short staple cotton is being grown in the Salt River Valley, and only the one variety of long staple (which is known as Pima), it has been possible to continually improve it by selection. The Pima variety is a mutation from the Yuma, which was the first grown and distributed through government agency. At the present time a greater effort than ever before will be made under the supervision of Mr. Hastings, formerly in charge of the Sacaton experiment station, now employed by the Southwest Cotton Company, to select the best plants for seed purposes. A larger acreage will be grown and the seed improvement will continue.

It is predicted that Egyptian cotton growers may eventually send to this country for seed. The long staple cotton industry has meant much to the Salt River Valley of Arizona and will probably be the means of developing many other sections equally as much as the Salt River Valley has been.

As an illustration of what this means, it might be said that the population of Phoenix in 1912 was 18,400; at the present time approximately 40,000. The population of the country tributary to Phoenix in 1912 was 50,000, and at the present close to 100,000. Deposits of Phoenix banks in December of last year totalled $23,559,026.15; deposits of these same banks at about the time of the beginning of the long staple cotton industry amounted to $7,068,551.33. The building permits for the month of March of this year were twice those for the entire year of 1912.

The acreage in the Salt River Valley has been increased from 200,000 to 300,000, and within the next year or two at the outside, 100,000 acres more will probably be added. These figures are tangible facts which show what the cotton industry has meant to the country where it has been developed to its highest stage of perfection.

More pleasing to the people of the Salt River Valley are the things which these figures mean, such as the paved streets in the cities; $4,000,000 bond issue for the roads throughout the country districts; splendid schools and school buildings; many public buildings that would be a credit to towns of larger size; and that general spirit of contentment and satisfaction which comes to a prosperous people.

HOME AND FARM FOOD PRESERVATION

"Home and Farm Food Preservation," by William V. Cruess, published by The Macmillan Company, New York, at $2.00. There is no more competent authority on food preservation than Professor Cruess of our state university, who has given years of careful investigation and through the university has issued many bulletins which have been of great value to fruit producers and home makers. In this book he has gathered much of this information in such form as to make it a fine reference work, likewise text book on food preservation. Of the volume the publishers say: "This volume tells the 'why' of the various methods of food preservation, presents labor saving devices and gives simple and explicit directions that may easily be followed. There are three main divisions in the text—first, the Principles of Food Preservation; second, Methods of Food Preservation; third, Food Preservation Recipes. The reading of the first two sections will make clear the fundamental principles and will give the student an understanding of the general application of these principles. This will be of assistance in carrying out the specific instructions in the third part." The 35 chapters touch on practically everything from why food spoils to recipes for dairy products which are included in the last chapter. These touch on canning fruit, vegetables, meats, juices, syrups, jellies, jams, marmalades, butters and preserves, fruit drying, vegetable drying and vinegar making. The text is made more complete by a large number of half tone engravings and line drawings. It is a valuable publication and should be in every home library.

CHEAP MONEY

It is a bit discouraging these days of extremely high priced money. Interest rates are vaulting beyond reason and the farmers are deprived of the federal farm loan bank services by the attack which has been made by large mortgage concerns, which is preventing the sale of farm loan bonds. There is a little relief being given by the joint stock land banks which are still operating, but necessarily compelled to reduce their loaning by reduced sale of their bonds. However, we have asked the California Joint Stock Land Bank as to the situation, and Vice-President Hendrick writes:

"This bank is still loaning money to farmers to the extent of its ability. The practical suspension of the federal land banks has resulted in an inordinate demand on this bank to loan money, and we are not able to take care of the immense volume of business that is offered us, but we are doing the best we can. Of course, it is a little discouraging in these times to attempt to market bonds when the interest rates on good paper are so high. We have not felt, however, like deserting the farmer entirely, believing that now is the time that he needs the assistance of the banks even more than he needed them some years ago, and we are endeavoring to be of every assistance we can."

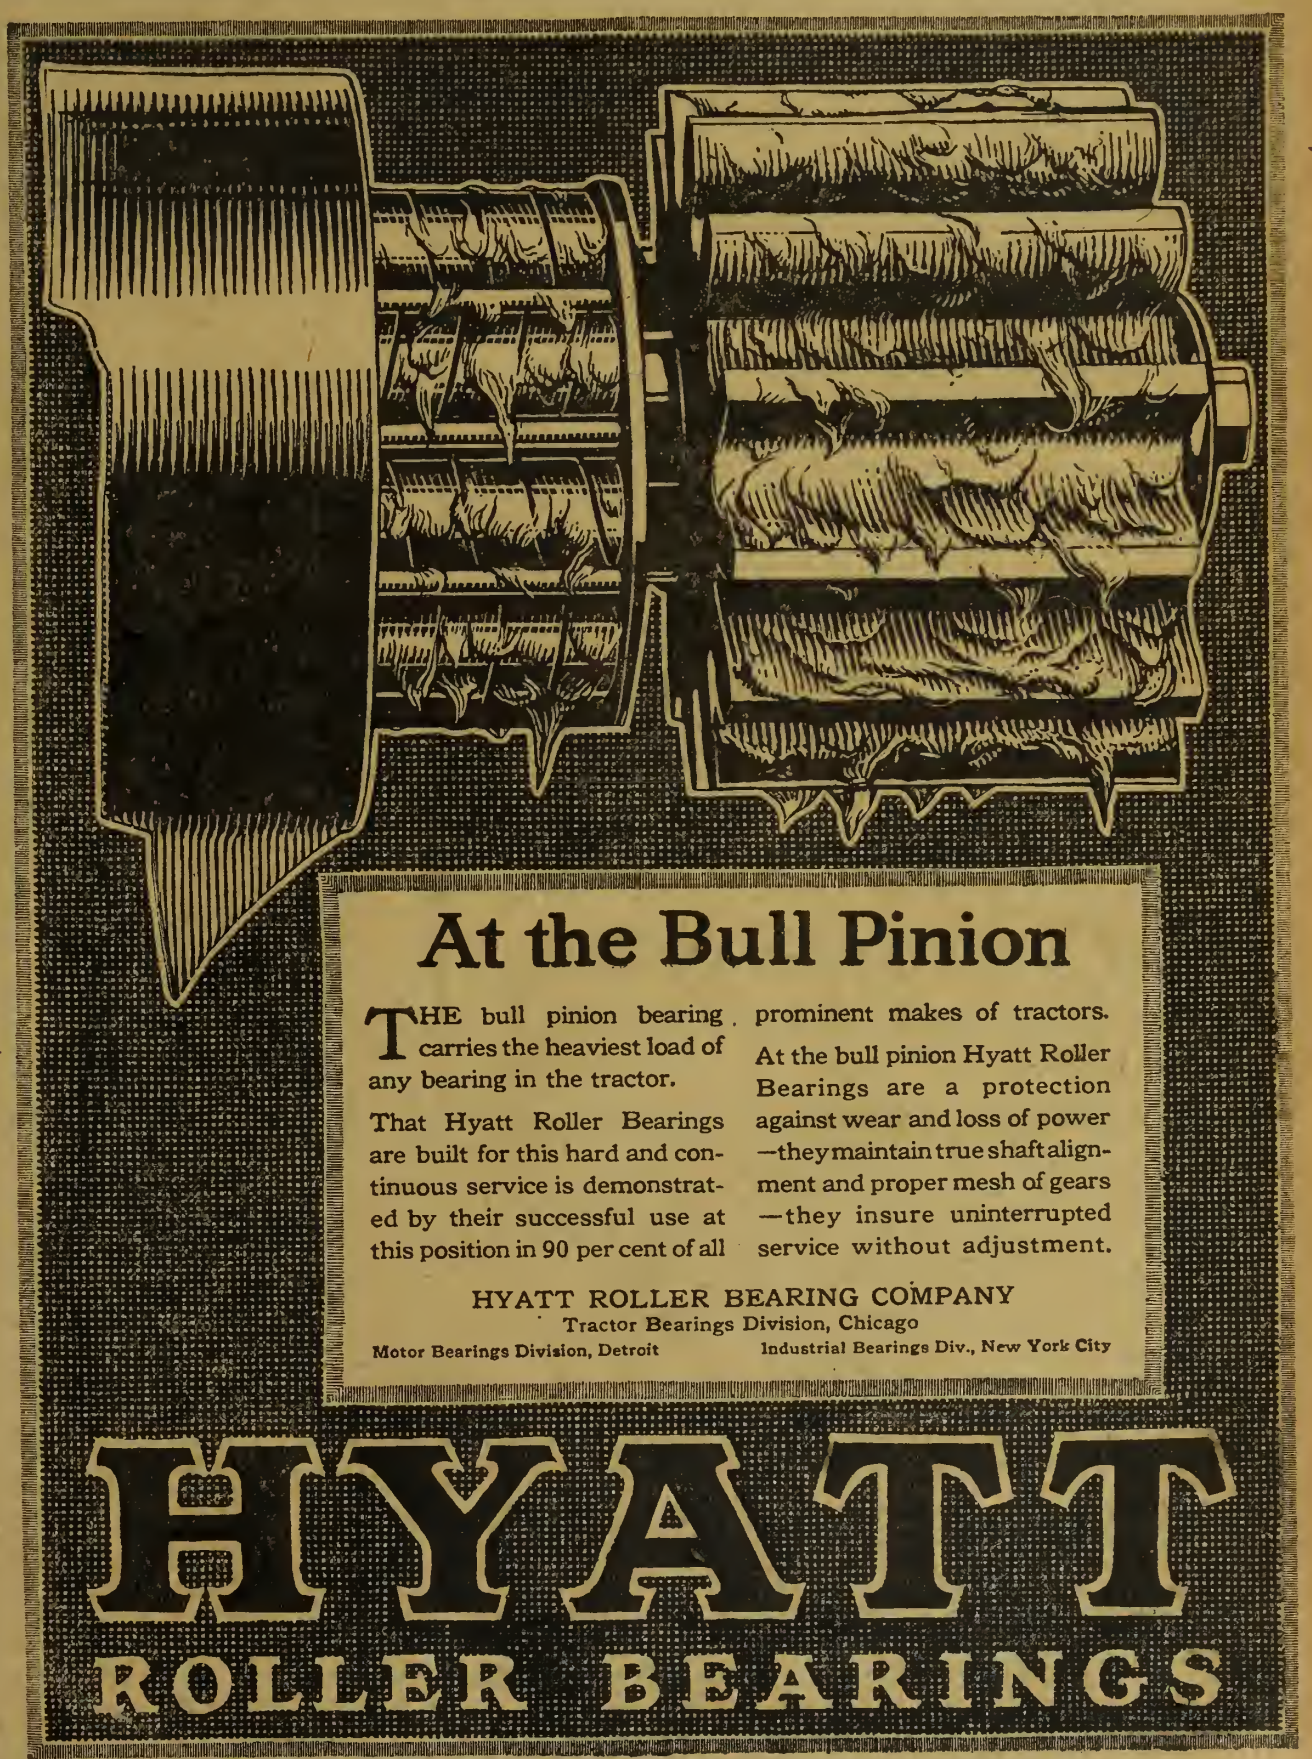
SUGAR CANE IN PERU

The area officially reported as now producing sugar cane in Peru is almost 100,000 acres, but the actual area is slightly larger. According to official returns the various districts produced 253,176 tons of sugar in 1917, and unofficial figures place the 1919 production at 300,000 tons. It is estimated that the 1920 crop will approximate 2,500,000 tons of cane, or 325,000 tons of sugar. This average per acre appears low and may be accounted for by inefficient cultivation on many plantations and an inadequate water supply. Land with sufficient irrigation and proper cultivation should produce 50 to 60 tons of cane per acre.

NEAREST AND DEAREST

Baggs—I see old Turpin, the millionaire, is dead. Who are his principal heirs?

Boggs—Dr. Smithson and lawyer Ellington.



At the Bull Pinion
THE bull pinion bearing carries the heaviest load of any bearing in the tractor.
That Hyatt Roller Bearings are built for this hard and continuous service is demonstrated by their successful use at this position in 90 per cent of all prominent makes of tractors.
At the bull pinion Hyatt Roller Bearings are a protection against wear and loss of power—they maintain true shaft alignment and proper mesh of gears—they insure uninterrupted service without adjustment.

SORGHUMS

If uncertain which varieties to order, tell us what interests you most—Quick Maturity, Heavy Yield, Minimum Moisture for Growing, Heat Endurance, Freedom from Birds.

DWARF WHITE MILO. Succeeds under a wider range of conditions than others of its class. Heavy yielder in grain; also in fodder or silage. Matures in 90 to 100 days.

EGYPTIAN CORN (Jerusalem Corn). A non-saccharine sorghum. Adapted to dry seasons and dry sections. Produces several heads on side shoots, often eight to a stalk. Seed makes excellent chicken feed.

HONEY SORGHUM (Saccharine). Grows anywhere that Indian Corn thrives, but will stand more drouth and heat. A new, heavy-yielding forage crop, sure to fill the silo. Slender, leafy stalks, 8-12 feet high, yielding 27 tons to acre without irrigation. Matures in 140-150 days.

FETERITA. Not eaten by birds so freely as other varieties. Heavy grain yielder.

KAFFIR CORN, White. For hot, dry climates. Grows 6-10 feet high. Makes good cattle fodder. Seed also used for stock and chicken feed.

SUGAR CANE SORGHUM (Early Amber). Quick maturing, so best for late sowing. Several cuttings possible in long season. Nutritious; heavy cropper. Makes excellent fodder if cut when heads form, or good silage when full grown. Syrup can be made from this variety.

BROOM CORN, Improved Dwarf Evergreen. Extensively used for making brooms. Preferred for its green color and fine long straight brush.

SUDAN GRASS As an additlon to the hay crop of California nothing more important has appeared. Yields 2 to 8 tons of hay to acre, depending on irrigation. Two cuttings sure—some places four. Superior quality hay relished by all stock. Ours is best strain.

SWEET FODDER SUDAN Tender and sweet, eaten by stock even when fully ripe. Quick maturing; yields till frost with irrigation. Tremendous cropper. A new, Callfornian, fault-free hybrid. Developed by Richard Diener especially for Western needs.

FRESNO, CALIFORNIA

The Cultivator Costs Only $1.00 Per Year

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fungus on Loquat

Dry spots appear in my loquat leaves and soon the whole leaf dries up. Can you suggest a remedy?—Subscriber, Oxnard.

This question was referred to Professor H. S. Fawcett, citrus experiment station, Riverside, and he replies:

"The specimen of loquat leaf sent in from Oxnard is affected with scab due to a fungus known as Fusicadium eriobotrae. This fungus also sometimes attacks the fruit. It is somewhat similar to the fungus causing apple and pear scab and the same treatment that is used for scab on apple and pear trees ought to give control also upon the loquat."

Moles

What is a good process for the elimination of moles? Our back lot is infested with them and as they work entirely underground there seems no way of reaching them with poison.—Subscriber, San Francisco.

The only way of satisfactorily controlling the mole pest is by trapping. There are regular mole traps which work very successfully once one learns the mole's habits. One type of trap consists of sharp prongs which when sprung penetrate the runway and possibly spear and kill the mole. The more satisfactory trap is the one with two pairs of jaws and with a trap which is sprung when the mole comes back through his former runway over which the trap is placed. If needed, oil the trap, but in any case secure quick and easy springing, then when set press down lightly and over mellow portion of the runway which the mole has made. Use care not to press down or close the runway over the side of the trap. Then when trap is set and the mole approaches either side he is under the pressed down portion of the runway, forcing the dirt up, and in doing this the jaws on either side close instantly. The mole does not eat or destroy the roots, so it is almost impossible to trap with vegetable or other poison baits. He lives almost exclusively on live insects. Mr. Stevenson of Gardena says he has had success by using the ordinary gopher trap, setting it at the end of the runway which has been cleared out.

Ground Beetles

Something is eating the outside and sucking the juice from our strawberries, both green and ripe. Thinking it might be snails, we looked at the plants after dark and found a bug smaller than a roach. They do not bother in the day time. What can be done?—H. W. H., Stockton.

These "bugs" are known as ground beetles; to the scientist a species of harpalus. They hide during the day under mulches, weeds, etc., and come out at dusk to feed on both ripe and green berries, though mainly after the seeds. Whether this is your particular pest or not, beetles of all kinds are hard to deal with and no method of control is known. It is said that in England, where a closely related species attacks strawberries, the growers endeavor to protect the fruits by sinking dishes in the ground baited with pieces of meat. This is too much trouble for us, and such bait at present H. C. L. outvalues the berries.

Economical Transportation of Hay by Trucks

A load of wealth in the form of alfalfa hay on truck and trailer. Recently exhibited at the Dairymen's Institute on the Los Angeles County Farm.

The cantaloupe crop of New Mexico will be two or three weeks later than usual owing to unseasonable cold weather making replanting necessary.

Power to Spare

All the power necessary for normal conditions—plenty in reserve for extraordinary work. This is the unfailing performance of "Caterpillar" Tractors. Coupled with longest life, freedom from operating troubles, and minimum outlay for upkeep, only one result is possible—"Lowest cost per working hour."

How to Kill SCALE
All Summer

Scale hatches all the year and multiplies very rapidly. Soon after hatching it feeds, then attaches itself to the tree AND NOTHING TRIED SO FAR KILLS IT when at this age. Fumigation will kill the newly hatched scale for the fifty minutes, when being applied, but what about the unhatched scale? It takes an INSECTICIDE thoroughly covering the tree to keep the young scale killed. THAT IS WHAT T-I-Z-I-T SPRAY WILL DO.

It also controls Red Spider, cleans the tree of fungus growth, stimulates the tree and cleans the fruit. Write us so you can see how well T-I-Z-I-T works in the grove nearest to you where T-I-Z-I-T has been used. Interesting pamphlet on request.

Moving Bees

Is there any law governing the bringing of bees into any certain locality? We have been informed that residents of a certain locality will get up a petition and prevent our bringing in bees. —Subscriber, Downey.

There is no state law in reference to the bringing of healtby bees into any certain locality. Bees are, of course, subject to state inspection laws, but that refers only to diseased bees. In many counties and many cities throughout the state there are local ordinances pertaining to keeping bees. It will be necessary for you to consult tbe board of supervisors of the county in which you live.

Claiming Inheritance

What is the limit of time in which one may claim heirship property in the state of New York?—Subscriber, Azusa.

To answer any such question would probably fill a large book, by reason of the different statutes and limitations which might be encountered. If you will state tbe concrete case, an answer may be readily given.

Keeping Roads Open

After a colony has been laid out, surveyed, roads graded and surveyed, placed on record, can anyone representing the owner of the colony or lessee prevent travel over the roads? I own a tract of land in the colony and live on it.—Subscriber, Sheridan.

Under tbe facts stated it would seem that the roads have been dedicated to the public and that they are, therefore, open to travel by anyone, whether tbat person be a resident of tbe colony or an entire stranger. Any interference with travel over such roads might render persons attempting to make such interference liable for serious penalties.

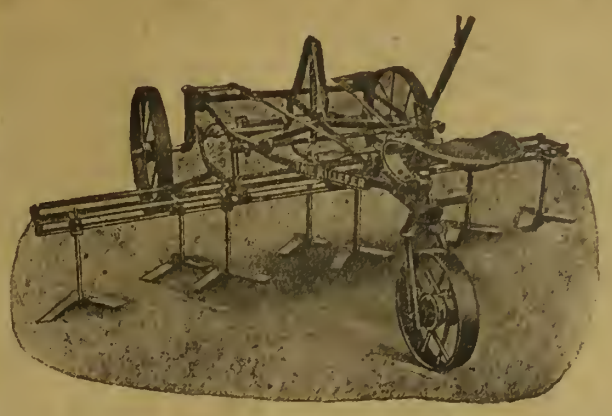
THE ENTERPRISING AMERICAN

An enterprising American bas secured from the Italian government a concession for the utilization of 800 horsepower of the waterfalls at Terni, about 70 miles from Rome, and maintains that he can turn out nitrogenous plant food for the Italian farmer at a cost as low as one lira per kilo (equivalent to $0.088 per pound, with the lira taken at its par exchange value of $0.193). An inspection of this plant from the standpoint of a layman serves to justify, in a large measure, the high hopes of the promoter of the project.

It may be said tbat the process has passed beyond the experimental stage, inasmuch as ammonia from this plant has already been put upon the market on a paying basis. There is, however, but one complete unit in operation, whereas the plant is designed to accommodate 12 producing units.

The subject is one of more than ordinary interest because it has a direct bearing on increased production of food in Italy. Italy's population has outrun its food supply, and one of the weakest points in the country's economic situation is the necessity of ekeing out home grown supplies through purchases in the United States and Argentina at adverse exchange rates. The production of cheap synthetic ammonia by means of mountain torrents which are now running to waste would prove an economic advantage of the first magnitude. It represents all the difference between freighting nitrates many thousands of miles from Chile and making something just as good at less than one-half the cost at home.

FOUR ROW BEAN CULTIVATOR



Killefer Efficiency

One man with two good size horses or small tractor, can cultivate four rows of beans with this cultivator. This, like most of our implements, has been developed at the request of ranchers, for a strong, simply controlled cultivator, capable of doing their work better than would be possible with a lighter made tool.

The frame is made of one piece high carbon steel with no joints to work loose or sag and holds the wheels always true and in line with balance of the cultivator. The double frame bar gives ample clearance between the standards and eliminates to a great extent, the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides; the steering device is easily operated and very accurate.

The cultivator is equipped with K. Q. sweeps of our own design, which will do better work and wear longer than the equipment usually furnished with other makes of bean cultivators. Standards can be set to cultivate rows of any width from 20 to 36 inches.

All repair parts are carried in stock so there will be no long waiting in case of a break down. We make this cultivator in two weights, four row regular and four row extra heavy. We also make a two row cultivator.

Note the following prices, f. o. b. Los Angeles, California:

BEET CULTIVATORS		BEAN CULTIVATORS	
Four Row, Regular	$145.00	Two Row, Regular	$145.00
Four Row, Extra Heavy	155.00	Two Row, Extra Heavy	155.00
		Four Row, Regular	160.00
		Four Row, Extra Heavy	170.00

A Portable Power Plant

The Fuller and Johnson Farm Pump Engine is an independent power plant that can be used for many purposes besides pumping. It will run separator, churn, fanning mill, corn sheller, feed grinder, washing machine, sprayer, or other light machinery. Can be attached to any pump without extra fittings. Delivers 270 to 2500 gallons of water per hour. Simple and economical to operate. Ask for catalog.

Buy a Kerosene Engine !

The rising cost of gasoline makes no difference to the owners of Fuller & Johnson Stationary Kerosene Engines. We can supply these engines in all sizes— 3 H.P. to 25 H.P. Model "H" gasoline engines from 1½ H.P. to 5 H.P.

Bugs, Cabbages and---Forests

By Charles H. Shinn

SINCE most of us, not being Fabres, call every insect a "bug of some sort," this article begins with what a bright Californian girl of 40 years ago said, noting her father's troubles with insect pests in his orchard: "Man's existence may at last depend upon but one crop—say cabbages—to the protection of which from 'bugs' all human energies will be directed." Not even Wells in his "Time Machine" ever imagined a more forlorn end of civilization, in a universal cabbage field long after orchards and forests have perished!

What is the heart of the "bug problem" of today in American forests? Let us try to sum up the technical results so far obtained by the busy field entomologists who are at work with the bug destroying crews. One of these entomologists is John M. Miller, a graduate of Stanford, then a ranger on the Sierra national forest, and now for years with the bureau of entomology, with headquarters first at Corning, then at Yreka, then at Ashland, Oregon. He will now spend several years in the Sierra, with headquarters at Northfork, Madera County, and his immediate objective the clearing up of the insect infestation in and near the Chiquito Basin. His title is "assistant forest entomologist" and he is assigned to "forest insect investigations."

A forester's "bug problem" is very different from that of the horticulturist. One reason for this comes from the fact that the small beetles of the genus Dendroctonus, which do most of the damage, are as old as the forests themselves and have certainly survived all the fires of every sort in all seasons for many centuries. At times the timber loss from their depredations has exceeded the annual growth, has not been fully restored by reproduction and has thus eaten into our forest capital.

The first of our problems, therefore, is to keep this annual loss as low as possible; the second, but closely related, problem of forest management is so to "open up" all the forests that insect infested mature trees can be utilized for lumber, though if such trees can be kept alive for 20 years it seems likely that market demands will make all of them available.

The third problem is to study, reduce and finally prevent those occasional large scale attacks of these beetles which one might call forest epidemics.

How are such problems met? Directly, by constant warfare upon the insects, and indirectly by the steady improvement of forest theory and practice. The notion, however, that fire, the greatest enemy of the forest, can be so used as to destroy these beetles without damaging the trees is contrary to the facts. Fires, large or small, attract the insects and greatly increase local infestations both of young growth and of mature timber. As the entomologists declare after years of field work, "controlled fires"—if such exist—can do no more to eliminate these beetles than could complete control of the beetles do toward the elimination of forest fires. Such is the definite conclusion after some 15 years of practical work with fire and insect problems in American forests.

Sweet Potato Flour

By Z. B. Wales

Mr. Kimball of the Beales-Kimball Manufacturing Company, Van Nuys, is the progressive citizen who is introducing this commodity to California.

In an enlightening chat with him the other day he told me sweet potato flour is not new to the South, the Tuskegee Institute, for instance, having manufactured it quite extensively for some time. So far as he knows, however, his is the first attempt to make it in this part of the country. The location of the plant at Van Nuys is entirely logical for the sweet potato grows splendidly in the sandy soil of that vicinity.

The process of preparing the potatoes for grinding into flour is simply one of perfect dehydration. As Mr. Kimball puts it, they must be absolutely "bone dry." The potatoes are first peeled in a circular, fast revolving peeler that really does not "peel" them at all, as we use the word in our own kitchens. It only rubs off the outer skin, thus saving to the final product what everyone knows is the best and most nutritious part of any potato, the part immediately next to this outer skin and which usually goes into our garbage cans.

After coming out of this machine every individual potato is gone over by hand and any discoloration or other imperfection cut out. After a steam bath of high temperature the thinly sliced potatoes go on large wire trays, a dozen or so of them being put on one dolly which runs on a tiny track into the dehydrating machine. To my unmechanical mind this huge machine loomed up as a gigantic mystery, but I do know that within its cavernous depths, guided always by the master hand of the scientist, takes place the vital process of making sweet potato flour, and that through its little glass windows may be ascertained at any moment of the five hours the process requires the exact temperature and moisture within.

The dehydrated sweet potato looks like fine chips and does not proclaim the promise of the lovely yellow flour, the making of which bids fair to become one of our big new industries.

This flour is not intended to be used alone, but in combination with other flour in the proportion of not more than one to three. To me the very name, sweet potato flour, sounds good, and it is good, for proof of the pudding is in the eating and I have eaten it raw and cooked.

The very evening of the day I called on Mr. Kimball I entertained two guests at dinner, the piece de resistance being hot muffins made of three-quarters whole wheat flour and one-quarter sweet potato flour, a part of the generous sample I had brought home with me. They were delicious, and only a polite reluctance to record the quantity of food my guests consumed makes me refrain from stating just how many each one ate. Still, at my house we make them fairly small as we like plenty of nut-brown crust, so perhaps half a dozen isn't so very many after all.

The next day came a cake! Mr. Kimball had told me some of the wise bakers were using a small quantity of sweet potato flour and were able, because it is so sweet and rich, to use one egg where formerly they had needed four. Our usual little every day loaf cake calls for three eggs. This one was made with one egg, shortening and sugar a trifle under measured, and about five parts white flour to one of the yellow. Even our cake connoisseur couldn't tell the difference and not one last crumb of that loaf went begging.

It is proposed to use the flour in making a prepared pancake flour. The very thought brings to me a mental picture of every one of the family calling for more.

As I write these words there comes floating in to me a most delicious odor. "What smells so good?" I call out kitchenward. Promptly the answer comes back, "A loaf of nut bread made with your sweet potato flour, one to six."

SUGAR BEET PRODUCTION

Heaven may temper the wind to the shorn lamb, but does not always add sweetening to the pulp of a sugar beet during a sugar famine.

Figures compiled by the bureau of crop estimates show a slight falling off in the amount of sugar extracted from the sugar beets in 1919 when

compared, pound for pound, with the crops of preceding years. In the United States, and including the beet crop from 850 acres in Ontario, 5,887,557 short tons of beets produced 726,451 short tons of sugar in 1919, while 5,577,506 tons of beets from the same sources in 1918 gave us 760,950 tons of sugar.

In 1919, moreover, the average production of beets per acre was 9.27 tons, while the average in 1918 was 10.01 tons.

The 1919 crop sold for $11.74 per ton of 2,000 pounds as against $10 for the 1918 crop, and the total value of the two crops was $75,420,000 and $59,494,000, respectively.

GRASSHOPPERS GET OUR PROFITS

Director Hecke of the department of agriculture has issued placards which are being posted over the state, "Grasshoppers Get Our Profits." Spread grasshopper poison and prevent this loss.

Formula

Paris green (or white arsenic), one pound; molasses (cheap black strap), two quarts; lemons(ground very fine), one-half dozen; water, four gallons; wheat bran (or alfalfa meal), 25 pounds.

Add the molasses, poison and ground lemons to the water first. Stir thoroughly, then slowly pour this solution over the bran and stir until an even mixture is secured.

Spread the wet poison bran mixture very finely by hand from a bucket or with an end-gate grain seeder attached on the rear of a wagon.

The above amount is sufficient to cover four or five acres.

In orchards and cultivated fields spread the poison in the forenoon. On alfalfa and grassland spread it in the heat of the day and before cutting the crop.

Keep livestock away from bags containing the poison mixture.

BEETS UNDER IRRIGATION

"Sugar Beet Growing Under Irrigation," issued originally in 1914, is now revised and reprinted as Farmers Bulletin No. 567, United States department of agriculture, and may be obtained by writing Division of Publications, United States Department of Agriculture.

Sugar beets are grown commercially in 17 states. In ten of these states the growers depend upon irrigation for a part of their moisture in producing this crop. The successful production of sugar beets under irrigation depends not only upon an adequate supply of irrigating water, but upon a suitable system of crop rotation, a thorough preparation of the seed bed, careful blocking and thinning, timely and thorough cultivation, and a supply of livestock which will balance with the crop production of the farm and include the utilization of beet tops, pulp and waste molasses. In addition to a suitable irrigating system the land should be provided with a satisfactory system of drainage, which may be either natural or artificial. Furthermore, the soil should be well supplied with humus, which may be furnished either in the form of stable manure or green crops plowed under.

Efforts are being made to relieve the labor situation by the construction and utilization of labor saving devices, such as hill planters, beet toppers, beet harvesting machines and unloading devices, and by distributing the beet plantings and so adjusting the crop and livestock production on the farm that the labor is distributed over the season. This bulletin should be of interest to farmers in the Northern and Western states who depend in part upon irrigation for the water necessary for crop production.

STATE FAIR PREMIUM LIST

Secretary Chas. W. Paine is mailing a very complete premium list of the California state fair to be held in Sacramento, September 4-12. In addition to the complete premium list there are lists of other fairs, information regarding the shipping of stock and other exhibits, rules and regulations of the association and illustrations including portraits of the governor and board of directors. This premium list is by far the most attractive ever issued by the state board of agriculture, the cover design being both striking and artistic. The list requires 250 pages and is most complete as to every department. The board consists of John M. Perry, Geo. W. Pierce, E. F. Mitchell, T. H. Ramsay, E. Franklin, Fred H. Harvey, H. A. Jastro, I. L. Borden, E. J. Delorey, Geo. C. Roeding, T. H. Dudley and Ralph W. Bull. The president is Geo. C. Roeding and the secretary, Chas. W. Paine.

BLASTING SANDY SOILS

The quickest way of telling how to blast ordinary loose sandy and gravelly soils is to say "Don't." If they are not cemented or unduly compacted, to break them up will actually reduce their productiveness rather than increase it.

The reason is easily understood when we reflect on the fact that any soil holds its useful moisture in the form of films about particles. The more particles there are to the cubic inch, providing they all lie loose enough to permit of holding the moisture films about them, the more moisture the soil will hold. To spread the particles by blasting is to reduce their number per cubic inch, hence to reduce the moisture holding capacity. The drainage of free water in these open soils needs no improving.

What is needed is to provide the material which organizes the grains of sand into the granular condition required for best feeding of plants—humus. Sandy and gravelly soil well filled with the remains of plant leaves and roots is exceedingly productive and will withstand much dry weather. The best reliance for humus is not the portion of crops which we can plow down, though that is indispensable, but the roots which penetrate the deeper soil and thus need no plowing down.

FAIR DATES

Sonoma County Fair, Santa Rosa, August 25-29. Secretary J. Francis O'Connor.
Patterson Fair, Patterson, August 26-28. Secretary T. J. Moe.
California State Fair, Sacramento, September 4-12. Secretary Chas. W. Paine.
Tulare County Livestock and Agricultural Show, Tulare, September 14-18. Secretary John A. Rollins.
San Fernando Valley Fair and Market, Owensmouth, September 15-18, Secretary Chas. L. Schufeldt.
Kings County Fair, Hanford, September 21-25, Secretary Frank C. Russell.
Ventura County Fair, Ventura, September 22-25, Secretary L. P. Hathaway.
Glenn County Livestock and Agricultural Association, Willows, September 27-October 2. Secretary E. A. Kirk.
Fresno District Fair, Fresno, September 28-October 2, Secretary Walter C. Ficklin.
Los Angeles Livestock Show, Los Angeles, October 2-10, Secretary C. R. Thomas.
Siskiyou County Fair, Yreka, October 5-9, Secretary Claude R. Gillis.
Southern California Fair, Riverside, October 13-19. Secretary W. W. Van Pelt.
Western Royal Livestock Show, Spokane, Washington, November 1-5. Secretary Bert L. Hilborn.
Pacific International Livestock Show, Portland, Oregon, November 15-19.

The only sandy soils benefited by blasting are those which have cemented. Once in a while a silty sand will do this, particularly if tramped or allowed to become low in humus, and the result is not much different from hardpan. Blasting them will break up the compacted layer. Immediately after the blasting the effort should be, first, to fill the broken soil with organic matter, and, second, to work it together into a close, granular condition.

FORESTS

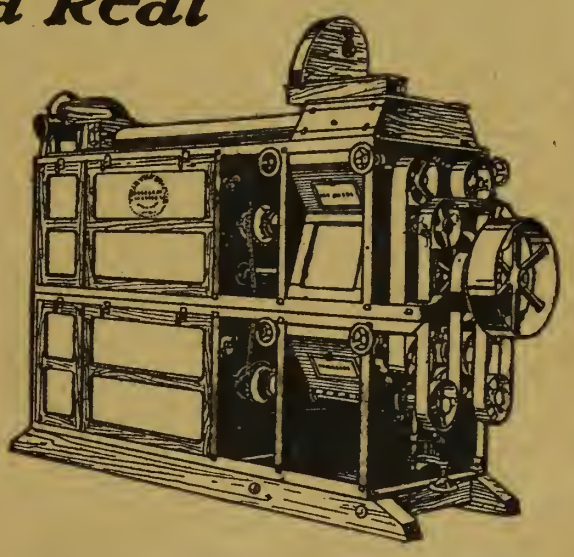
The quantity of lumber cut every year in the United States is three times the natural growth. At the present rate of destruction the forests will have disappeared in less than a generation. The center of the lumber districts has been pushed rapidly westward until today it has reached the state of Washington, and is approaching the Pacific coast. The most serious drain upon the forest resources is for railroad ties.

GENERAL INFORMATION

"This 'ere is a husking peg," explained honest Farmer Corntosell, who was showing his city nephew round the farm. "We use it to husk corn with."

"Well! well!" was the surprised reply. "I always supposed you kept bees to do your husking for you. I remember reading something about husking bees—they had red ears, if I recollect correctly."

This Money-Making Mill
Will Make You a Real Money-Maker



Be the all-year-round money maker in your section for the rest of your life by getting into the flour milling business with this XXth Century money making flour mill. It will make you more money from the very start on less capital and less labor than any other high class business you could go into. We start you right. And there is no better time for you to start than right now as the country needs and must have more flour mills. There is only one mill to every 15,000 people and the population is growing fast. So is the demand for more flour mills. The real all-year-round money maker is

The XXth Century

Ball Bearing Roller Flour Mill
"Less Power - More Flour"

It is the very latest word in the highest perfected flour milling machinery. It affords men of moderate means a chance to get into one of the very best paying businesses in the country for the money invested. And without having been in business before. It is so compact and so complete in its construction that it takes up but very little space and requires but very little power to run it. It can be looked after by one man. It makes, according to size, from 25 to 50 barrels of the very finest roller flour a day with all the natural flavor and essential food elements intact as nature put them in the grain. Being a complete roller mill system all in one machine, it gets out all the flour that is in the wheat grain and a flour that will compete with any other flour made by any other mill anywhere.

Not only is this XXth Century Mill perfection the very latest word in the science of flour making machinery, but it is the product of the very finest workmanship. Every part is milled and fitted with the skill and care of the watchmaker's art.

It is ball bearing throughout which not only insures better results in the milling of flour, but a saving of at least one-third in power, as well as adding greatly to the mill's durability.

The XXth Century can be run by any kind of power, water, gas, steam or electricity. Many use a small size gas engine.

Look into this XXth Century money making flour mill proposition now as a steady continuous lifetime paying investment for you or for yourself and friends in your community who go in with you. Many make it a neighborhood proposition for the accommodation of the community as well as a big profit paying investment for themselves. Get this mill yourself and be the miller for both the dealer and consumer for miles around. You will command their trade with the high grade flour you make with this money making XXth Century Flour Mill that is making so much money for others just as it will make it for you. Fill out and send in this coupon for further information, prices, terms, etc. Get in on it before somebody else in your territory does.

Send in this Coupon for Full Particulars Now!

Jumbo Sensation

The largest boar of his age of any breed in America. He cost $15,000, record price for a junior yearling boar.

JUMBO SENSATION is a son of Mammoth Sensation, the largest boar of the breed. He was 44 inches tall and 10 feet 6 inches in length tip to tip.

Good judges who have seen Jumbo Sensation declare that he will make a larger boar than his sire.

JUMBO SENSATION comes to California. He was the outstanding Duroc boar of the East. In fact, he has created a tremendous sensation in Eastern Duroc circles where big Durocs are common.

He comes to California to head a herd that will not be famous for the great numbers bred, but to a herd that is built on foundation stock, backed up by the greatest sires and dams of the breed.

JUMBO SENSATION will weigh 1100 lbs. when matured. He will produce many big Durocs that will help put California on the livestock map.

Come and see this giant of the breed.

JUMBO SENSATION was selected for the TU-TOC-A-NU-LA Ranch by R. K. Walker.

When Writing Advertisers Mention California Cultivator

The Passing Show of 1920 in Cattle Prices

By A. L. Spellmeyer

JUNE opened with fine weather, lower beef prices, called loans, and panic stricken cattle producers in many parts of the range country. The bogy worked its will and cold finance added its chill.

Of all the foolish reports rampant with the cattle producers of Arizona hurrying to meet the call of dangerous six months paper, none was more wild than appeared in a great daily, the friend of the people, stating that 200,000 head of fat Arizona beef were ready to be shipped at once. The estimable reporter, granting his excellent intention to always assist cattle production, has been "bulled," but many California men who have beef to sell naturally assume they must go to eight or nine cents to meet all this eager horde of great beef cattle waiting to be absorbed by a reluctant people of Los Angeles on the 50 cent steak basis. From what we infer the tallow is dripping from the sides of these very fat animals offered in such great numbers at such low prices.

There are many cattle for sale, but alas and alack! it's the same old story—a glut stimulated by controlled financing, and every hoof that comes from Arizona this year over last year's calf crop numbers means drawing upon the capital of that state of producing cattle and less stock for the future.

Now Arizona has 1,100,000 total cattle, according to the Year Book of the department of agriculture, 1919. Any man who could get together spring and fall both in central and northern Arizona 30,000 steers, twos and threes, would be a great close comber, and as much more in the south would be a greater task. Arizona has only a short time each spring and each fall to work; cattle must be held in herd and driven long distances and then shipped for three to six days on a train. Any cow which ends in fair condition is lucky, as any buyer of a packing house is afraid of bruised cows. To get Arizona twos and threes steers in the spring buyers must purchase yearlings, as the larger steers are merely mixed in. As far as the great state of Arizona supplying countless hordes of fine fat beef for healthy Los Angeles epicures, it's a dream not far to go and in permanenec or percentage negligible. Everyone is glad Arizona has had a fine year, and with all its called loans money is needed, but it's a feeder state and supply point for young cattle. Its total output of all grades, yearling steers, heifers, old cows and aged steers, does not average over 250,000 yearly shipped out, and that supply is absorbed from Texas to Kansas and from Colorado to Montana. The last authentic sale I heard of for fair yearlings was on 38.50 basis Arizona, ten months up yearlings, or equivalent to eight cents a pound f. o. b. Arizona.

California slaughters over a half million cattle yearly. As to the multitude of California beef, it does not exist. There are some fat cattle on the Coast and around San Jacinto and some left around Porterville and Visalia, but I have seen San Francisco drawing some bum half fat steers at 9.50 and cows at eight cents.

There is right now more beef than can be assimilated, but the fall and winter of this year will tell a different story, and people who have feed and money are foolish if they don't buy cattle priced on 1915 valuations while they have the chance.

In various other districts there are a few, hut they are not here in a countless multitude. And one local San Joaquin butcher has contracted 125 top grass steers at 11 cents for his needs to August. Would he have done this if stock were plentiful?

There is no sale for anything, as we know, at any prices for feeder or stock cattle within last year's cost and expense price, but the buyers trying to fill up on eight cent feeders don't seem to make much headway.

Cattle may come to lower levels, but when cows and calves together are priced at $80 in the San Joaquin, all risk and expense a passed incident, stock is at a low valuation.

When one hears how the men in the Northwest are short of cattle and can't borrow money to restock, and when we hear that Texas is crying for stock for its grass and can't get money, and Kansas has its many thousands of unfed and unstocked acres, and that corn is lower and more farmers want to feed, one begins to feel better.

Down in the spring and up in the fall! Who would feed next year if the present levels continued? Where are men who would try to feed any grain or hay at present prices into nine cent beef? Cheaper hay and corn and higher beef would mean the greatest rush for cattle in this fall of 1920 this nation has ever known. With people talking about the great cattle surplus, where are the big steers of Nevada, Oregon, Utah or California? Killing cows always in such proportion as at present will bring its own answer and remedy. Why is the country shorter by 10,000,000 beef type cattle than some 12 years ago, according to the Year Book of the department of agriculture?

According to the Year Book our slaughter is greater than during those years we went behind. Cattle are safer than safe deposit vaults if a man has the money and can hold, but if he can't he has to sacrifice. The present play has been sudden, decisive and has gone the limit, and although it may be an unpleasant medicine, it's going to hurry the result and end uncertainty. The more I hear from various men from various states how bad cattle conditions are now, the more cheerful it makes me and the more certain that cattle production is about to come into its own.

BUTTER AND CHEESE SCORING CONTEST

The first of California's Educational Butter and Cheese Scoring contests for 1920 is being held at the university farm, Davis, this week.

The butter is scored by the double standard. The regular commercial score card will be used for judging quality and the plan below for judging composition and color followed: Color, 35; moisture, 25; salt, 30; curd, 10; total, 100.

There will be two classes of butter, gathered cream and whole milk. Any factory making half or more of their butter from cream skimmed from whole milk at the factory will be considered in the whole milk class.

There will be three classes of cheese—Cheddar, California (granular) and Jack.

Express on entries will be paid by the creameries and cheese factories. All entries will be sold to the highest bidder and the money returned to those taking part.

Each individual entry will be scored and criticized and a detailed score sent to those making entries.

There will be three scorings. Notice of each will be published in the trade papers and entry blanks sent to butter and cheese makers desiring to participate.

Butter and cheese makers taking part are requested to give a full report of the methods employed in making each entry to the contest.

The contest is under direction of G. D. Turnbull, assistant professor of dairy industry of the university.

CONTEST IN PURE BRED SWINE

Auction sale of extra high class pure bred registered gilts and young boars is to be conducted on the public school grounds at Owensmouth, Friday, June 18, at 2:30. Following are some of the offerings in Duroc-Jerseys:

One eight months open gilt, the choice of ten litters at Diamond Bar Ranch; three fine gilts from Pathfinders Model II, the wonderful boar at the Tu-toc-a-nu-la; one gilt, eight months old, 61 inches long, 32 inches high, weighing 360 pounds, pick of the Conejo Ranch. There are some weaned pigs offered from high class Eastern bred, Orion blood lines. Several ranchers are entering pure bred gilts for the sale. Thirty of the finest gilts in the state will be judged in a "Growing Out" contest as directed by United States department of agriculture The auctioneer comes from Sacramento to conduct the sale and help judge the contest. Many prizes and awards are being worked for. The San Fernando Valley Duroc-Jersey Breeders Association offers a silver cup val

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body — It is penetrating, soothing and healing, and for all Old Sores. Bruises, or Wounds, Felons, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Sore Lungs, Rheumatism and all Stiff Joints

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

REMOVES THE SORENESS—STRENGTHENS MUSCLES

ued at $75. Jay C. Craig and other breeders are offering prizes. Prof. J. B. Lillard, state supervisor of agricultural education; Prof. Gordon of the Los Angeles County farm adviser staff, and Glenn Waterhouse, assistant farm adviser will act as judges.

TYPES OF SILOS

There are many types of silos in use at present and they are built of many different kinds of materials. Most of them are good. Most of them give perfect satisfaction to the users, and the average farmer, if called upon to rebuild, would put up a silo of the same general type as the one he is now using.

The silo question is a vital one, yet it is one that is a long way from being solved. The silo agents have added to the confusion by assuming that their own particular type is far ahead of all others, and perhaps the silo agents should not be criticized for this attitude, because one of the requirements of a good salesman is a firm belief in his goods. At any rate, the farmer is often confused. He is likely to think that there is some one silo which is the only one for him to build, just as he often feels that there is some one breed of cattle which is a "cure all" for his troubles and which will bring success where others fail. Now there is no one and only breed of cattle, and there is no one and only type of silo. They all have a place, says W. W. Swett of the Missouri college of agriculture.

One of the oldest and most common types is the ordinary wood silo, held together by large adjustable iron hoops or bands. Such silos have been in use for years and have given satisfaction in most cases. Arguments against them are that they are not durable, that they are easily blown over and that it is a serious job to keep the hoops adjusted. As a matter of fact, while they will not last as long as some other types, they are as permanent as the other wooden buildings on the farm and are somewhat cheaper than some of the other types of silos. In some cases they will blow over, but when properly built and anchored they are not troubled except by a very severe wind which might play havoc with other farm buildings. The hoop adjustment is not a serious problem. There is no question but that the wood silo will burn if exposed to fire.

The hollow tile silo is popular in many localities. When properly built and reinforced it is very satisfactory. The desirability of building one will be determined largely by relative cost as compared with cement and cement blocks. The importance of reinforcement must not he overlooked.

The reinforced solid cement silo is probably most permanent, but it is rather expensive. If properly constructed it will last a lifetime and is fireproof. It will keep silage in excellent condition, in spite of arguments which some salesmen and others register against it. If sand and gravel and proper labor are not too hard to secure it is a good type of silo to huild.

The cement block silo is made use of in some places with good success. It must be reinforced, but when properly put up gives good satisfaction. It is sometimes to be chosen over the cement silo because of absence of sand and gravel for constructing the cement silo.

It is always advisable to hire a man who knows his business to build any one of the latter three so-called "mason constructed" types, as their construction is going to determine whether they are entirely satisfactory or utterly worthless.

A silo popular in the North is made of two hy four studding and shiplap inside and out. Then there are a number of other types such as the cement stave silo, steel silo, and ground or pit silo. There are still others.

Any silo which has good air tight walls that are smooth on the inside will usually keep silage in good condition if the silage is put in in good condition, sufficiently moist and well packed. Complaints are sometimes made that silage will not keep in some types of silos. In practically every case investigation shows that failure to keep is due to poor condition of silage, insufficient moisture, poor packing or poor construction of the silo rather than poor type of silo.

Feed less Grain—
Get more Milk—

Feed less grain and still increase milk production. You can do it with an Indiana Silo. Succulent, nourishing silage reduces rations of $60-a-ton grain.

"No other food," says the U.S. Dept. Agr. Bul. 855, "will combine so well with dry hay and a *little* grain to produce maximum economical results. A silo at all times, particularly now, offers to the farmer the best means of reducing his feed bills."

20,000 Indiana Silos

Twenty thousand Indiana Silos sold on the Pacific Coast. Manufactured from select straight-grain, knot-free Fir, logged in our own woods. Staves accurately matched. Air-tight tongue and groove joints. No spoilage. No leakage. No waste.

A Sound Invesment

Feedmen's profits will pay for an Indiana Silo. Siloing fodder saves 40% wastage. Butterfat costs have been reduced 10 cents a pound, beef production $2.50 per 100 pounds by feeding silage. Write for free book on Silos.

MAKE 1920 A SILO YEAR

(Continued from Page 939)

satisfactory silage crops as the ones first mentioned. Better results have usually been obtained where the legumes have been mixed with corn and the sorghums. It is quite feasible to make ensilage from alfalfa, but ordinarily it will be found more satisfactory to use only the first cutting that is more or less foul with foxtail. The better practice is to grow other crops for silage and use such feed as a supplement to alfalfa hay.

In sections where sugar beets are produced in quantities a satisfactory and cheap silage can be made from the tops. In Colorado thousands of tons are stored in pit and trench "silos" and feeders assert that a ton of beet top silage is worth a half a ton of alfalfa hay when fed as a mixed feed—some feeders even claiming it to be almost equal to good hay, ton for ton.

In considering the question of a silo, California ranchers can look upon a silo as the safest sort of investment. A filled silo is a most practical form of insurance against short feed and high prices, and in a year when the price of feed is certain to be above normal—and hard to get—the silo can be made to provide an economical and valuable feed.

Now is the time to plan for a silo and no time should be lost in planting a crop to fill it.

The men who take time by the forelock, who are forehanded, are the men who will make the profit—and most of the best livestock men will own a silo.

John Donaldson, Perris, was a buyer at the sale of Berkshires held recently at Hood Farm, Lowell, Massachusetts, and secured the boar, Baron's Successor Pluto and the sow, Wendover Gredle 2nd.

Range Cow Man Gives Methods

Range cattlemen will be interested in the following interview with a cattleman of Southern Arizona. We quote the entire story as given by members of the animal husbandry division, University of Arizona:

"Of course I wean calves. It is the only way. In September I take the calves away from the cows, or gather up the weak cows and give them special feed. It is not long before these thin cows pick up on good feed when the calves are weaned and they are sure to get with calf. It is important to wean in September, for I take away the bulls shortly after that and the cows should get with calf that fall. Any cows that fail to get with calf get fat and I sell them for they are poor breeders.

"I also have a special breeding season. From June 1 to September 30 the bulls are left with the cows, but after this time they are separated. The fat cows will breed soon after turning them together after June 1 and these cows calve in early March. The thin cows that are good milkers may calve as late as the end of June, but most of the calves come in April and May and are ready to wean in September. If the feed is good I wean the strong calves from thin cows as early as four and one-half months old. It is better for the cows and it does not hurt the calves to be weaned then. I get a late calf from that cow next year and she will get fat and strong. I do not believe in allowing the calf to injure the calf that is coming by keeping the cow thin up to calving time. Weaning the calves will increase the calf crop 20 per cent in any outfit. It will reduce the number of bulls required, cut loss in old cows in half and make cows last two years longer.

"The range cow that has been properly cared for until ten years old and not allowed to nurse big yearlings but put on a big range, will make as much money as a three or four-year old. I believe I make just as much money from my cows when they are eight to twelve years old as from the younger ones from four to eight years old. A thin cow that has developed good habits of calf raising will breed when young cows in the same condition would fail to bring a calf. Of course, cows begin to go down when ten years old; some of them younger, but if they have been maintained on brush range it is time to begin to get rid of them when they are ten years old. Cows that have been compelled to eat browse will usually play out two years sooner than those that have been on a good grass range.

"Speaking of pastures, I believe in having as many of them as possible. Every outfit should have at least four pastures. One of these should be allowed to go to seed every year and if possible two of them. This will greatly improve the quality of the range and a fellow needs the pasture in the winter time and early spring. It does not hurt one bit to pasture these fields after they have gone to seed, because after this time the roots are strong and contain an abundance of reserve to force growth for a year or two.

"A pasture should also be available for keeping heifers in, for weaning calves, maintaining horses, gathering beef, etc. Breeding pastures are mighty useful. It is also necessary to have a separate pasture for the bull from October 1 to June to keep the bull away from the cows.

"I have been watching this cattle business for a good many years and the more I know about it the more convinced I am that we have got to adopt new methods of management. The old way of rounding up cattle, roping them and injuring the stock won't do any more. Three years ago I was at the stockyards where an outfit of about 300 head was sold. In counting them the cowboys were so rough that they injured 15 cows. This is surely a great mistake. Not only were 15 cows injured, worth, say $40 or $50 a cow, when not one of them should have been injured in any way but quite a number of the cows were not much better off. Salting cows abundantly, supplying them with feed during the short range period, managing the business in a thorough up-to-date way will do much to make the business a success."

WELL BRED HOGS MAKE GAIN MOST RAPIDLY

That blood will tell in hog feeding has been established to the satisfaction of W. H. Harper, a Missouri farmer, who, under the direction of the Missouri college of agriculture, has been conducting a hog feeding experiment to determine the results of feeding various grades of hogs. He used thee lots—one of scrubs, one of half breeds, and one of pure breeds. The experiments, after running about 200 days, showed striking results. The lot of pure breds weighed about 350 pounds, the half bred lot about 300 and the scrubs about 160. These lots had all had the same care and treatment. Another experiment will be begun soon and records kept to furnish definite information.

Dispersal of a Beautiful Herd
70—Young Registered Holsteins—70

EDGEMONT FARM OWNED BY C. W. ANDERSON BURBANK, CAL.

Thursday, June 17, 1920, at 10 A.M.

Beryl Mortum Luecke De Kol
A 26.51 lb. three year old daughter of Beryl Luecke De Kol.

Mabel De Kol Niko 2nd
A 24.52 lb. four year old daughter of Roderick Lincoln out of a 30 lb. daughter of Plebe Paul.

This is widely rated as one of the choicest herds in California, and this rating is based upon an unusual combination of good breeding, good size, extraordinary average type, and a rare history of good health.

YOUNG FRESH COWS—HEAVY SPRINGERS—BRED AND OPEN HEIFERS

17 DAUGHTERS OF BERYL LUECKE DE KOL, a young proven sire with 19 A. R. O. daughters, the oldest one a 3 year old with over 26 lbs. butter in 7 days, and she is in this sale.

12 DAUGHTERS OF RODERICK LINCOLN, who has 37 A. R. O. daughters with records up to over 33 pounds butter in 7 days. The largest list of tested daughters credited to any bull yet developed on the Pacific Coast. His dam made 946.25 lbs. butter from 21628.4 lbs. milk in one year.

7 DAUGHTERS OF ABYLA WITKOP, a high class group of extraordinary type and splendid production.

13 DAUGHTERS OF DUKE BANOSTINE BUTTER BOY, his sire a son of Friend Hengerveld De Kol Butter Boy and a daughter of Pontiac Aaggie Korndyke, and out of a dam that made 623.05 lbs. butter from 15427.7 lbs. milk in 305 days.

A DAUGHTER OF KING SEGIS PONTIAC JANNEK, out of a half sister to the 34 lb. cow Jessie Fobes Bessie Homestead that made 932 lbs. butter in one year and sold for $4600 in the Detroit National Sale.

A DAUGHTER OF JULIANA KING REPEATER out of a daughter of a 3 year old that made 678.16 lbs. butter in one year.

A DAUGHTER OF KING SEGIS PONTIAC, bred to a grandson of Tilly Alcartra.

A GRANDDAUGHTER OF KING KORNDYKE SADIE VALE, out of an 18 lb. 2 year old granddaughter of Sir Fayne Concordia.

A DAUGHTER OF MERCI LAD KORNDYKE BURKE, son of the first cow to make 1200 lbs. butter in one year in California, out of a 24 lb. 4 year old whose sire is out of a three-quarter sister to the first 41 lb. cow, Valdessa Scott 2nd, second dam with 731 lbs. butter in one year, third dam with 716 lbs. butter in one eyar.

A DAUGHTER OF PRINCE GELSCHE WALKER, out of a 26 lb. daughter of De Kol Hengerveld Burke, second dam a 26 lb. 4 year old daughter of Johanna Rue 3d's Lad.

TWO DAUGHTERS OF RODERICK ARALIA DE KOL PONTIAC MEAD, who is by a son of De Kol of Valley Mead 2nd and out of a 33 lb. daughter of Roderick Lincoln.

A DAUGHTER OF ARALIA DE KOL PONTIAC MEAD, whose sire is a son of the former world's record cow Aralla De Kol, and whose dam is De Kol of Valley Mead 2nd, 1011 lbs. butter in one year as a 4 year old, she the dam of the 1113 lb. 3 year old Miss Valley Mead De Kol Walker, whose son King Korndyke Pontiac 20th sold for $12,000 in the W. J. Higdon sale.

DAUGHTERS OF HIGH RECORD DAMS, ranging up to over 30 lbs. butter in 7 days.

King Morco Alcartra 5th

The herd sire, King Morco Alcartra 5th, will be sold. He is by King Morco Alcartra, son of Tilly Alcartra, the world's greatest dairy cow, and is out of a 21 lb. daughter of Prince Gelsche Walker and De Kol of Valley Mead 3d, who made 845.11 lbs. butter in one year, and she is a full sister to De Kol of Valley Mead 2nd, 1011 lbs. butter in one year as a 4 year old, she in turn dam of Miss Valley Mead De Kol Walker, 1113 lbs. butter in 348 days as a junior 3 year old, and she is the dam of the $12,000 bull King Korndyke Pontiac 20th. Practically all of the females of breeding age in the sale are in calf to this sire, which should add much to their attractiveness and value.

K S P J COUNT, a son of Mr. James J. Jeffries' famous herd sire, King Segis Pontiac Jannek and the 29.48 lb. cow Agnes Canary Segis, will be sold. He is just ready for light service and should go to a good herd.

REMEMBER that every animal sold is positively guaranteed to be a breeder; that every animal over six months of age has been tuberculin tested by the subcutaneous method by Dr. Hurt, County Veterinarian of Los Angeles County, and is sold subject to retest by the buyer.

EDGEMONT FARM is for sale. If interested in one of the most productive, most profitable farms in Southern California, address the owner, C. W. ANDERSON, Burbank, Calif.

Record Duroc of California

California is importing some remarkably fine livestock. Feeds are at prices almost prohibitive, while prices paid to producers for the hogs that consume the feed are far from satisfactory. Hence, only high quality stuff which utilizes every ounce of the feed can be handled with profit. Duroc-Jersey breeders are doing their best in meeting the difficulties by importing some of the greatest producing blood. F. F. Devore, who is thoroughly conversant with Durocs and who has shown great foresight in selecting high producing boars, writes regarding a recent importation:

"The best and largest junior yearling boar I have seen this year has just been purchased by Mrs. R. E. Whitley of the Tu Tock A Nu La Ranch, Van Nuys. R. K. Kalker selected this boar after he and I had looked over all the good boars of Nebraska, Iowa, Minnesota, Illinois, Ohio and Kentucky. Jumbo Sensation is a March yearling and is sired by Mammoth Sensation, he by Top Sensation, a litter mate to Great Sensation, and they by Great Wonder I Am, the only boar of the breed that ever weighed 1,100 pounds. Mammoth Sensation was the largest Duroc that ever lived, weighing in thin flesh 1,050 pounds, standing 44 inches high and 84 inches long. He attained this size at two years of age, at which time he was killed by heat. Now Jumbo Sensation was purchased from I. J. Swain and Sons of Malvern, Iowa, for $1,500. He is the highest priced junior yearling in the breed's history and is closely related to the champions at the Iowa, Minnesota, South Dakota, Idaho, Nebraska, Missouri, California, Utah and National swine shows. He is the largest boar of his age I have seen and would defeat any boar of his age I know of. Mrs. Whitley has in Jumbo Sensation one of the greatest boars in America, a boar that will make Duroc history on the Coast. He looks like a real champion and I say to my friends in California that if you want to see a genuine big type boar, the biggest there is in America, go see Jumbo Sensation. I understand Tu Tock A Nu La Ranch is going to put in a small but very high class herd of Durocs; they certainly made a ten strike in sending Bob Walker back here and getting a boar of this caliber. I say he is the best boar that was ever shipped out of Iowa."

Tentative Wool Grade Types

Tentative types representing various grades of wool have been prepared by the bureau of markets, United States department of agriculture, in connection with its investigational work looking toward the ultimate establishment of uniform wool standards. The types decided upon by government experts have been prepared after careful examination of thousands of samples that represent the opinion of the trade generally as to what should comprise wool standards, and which now form the basis of commercial transactions.

It is proposed to demonstrate these types to wool growers for the purpose of determining the practicability of their application upon a commercial basis. These demonstrations will be conducted by wool experts sent out from Washington to assist the bureau of markets field agents.

There are now no fixed wool grades in universal application, with the reign countries with regard to the producer's product is based upon arbitrary standards fixed by individual buyers. It is therefore obvious that to place the business upon a uniform basis would be decidedly advantageous to all concerned.

For several years the bureau of markets has been conducting investigations and making a study of wool samples collected from all states and foreign countries with regard to the possibility of establishing uniform wool standards, and the work has now reached the point where the wool experts in charge feel warranted in submitting their findings to wool growers for consideration. Of course, it must be understood that the work is still at an investigational stage. It would be unjust to fix grades without first securing the views of the wool growers themselves, and the types to be demonstrated are simply intended to form the basis of further investigations in the field. At the same time, the types prepared represent the consensus of opinion of experts who are practical wool men, and it may very well be that but slight changes will have to be made in these types in order to produce grades acceptable to wool growers generally.

The cooperation of all wool growers is urged in connection with this work. Those interested in the demonstrations may secure full information by writing the Bureau of Markets, United States Department of Agriculture, Washington, D. C.

Save Waste of Pure Bred Calves

Nature has her own percentage rules which are as infallible in the long run as the dealer's margin at a Monte Carlo gambling resort. According to this inflexible law of averages, there are about as many bull calves born each year as there are heifer calves.

Every good dairyman knows the value of a pure bred sire of good record and what such an animal may accomplish in the way of improving a grade or scrub herd. Despite their acknowledged value it appears that 73,000 pure bred bull calves of dairy breeds were killed for veal or were fattened for beef in 1918.

A chart has been prepared by the dairy division, United States department of agriculture, which furnishes a graphic illustration of what happened to the pure bred bull calves in 1918.

The line representing pure bred Holstein-Friesian cows registered in 1918 runs out to 80,000. The line for the bulls of this breed registered during the same year extends only to 30,000. The difference, 50,000, represents the approximate number of bull calves not registered. Presumably most of them were either vealed or fattened as steers.

The Jersey breed in 1918 registered 30,000 cows and about 12,000 bulls—a loss of 18,000 pure bred sires, many of which might be more profitably employed in the work of improving scrub herds.

Guernsey and Ayrshire totals are less, but the percentage of loss is heavy there also.

In the face of this waste it is estimated that five grade or scrub bulls are in use for every pure bred bull. According to experts of the United States department of agriculture the replacement of scrub and grade bulls with good pure breds would quickly and materially raise the average production of dairy herds. One of the reasons for the surprising situation outlined is probably an underdeveloped system of distribution.

$15 HOGS

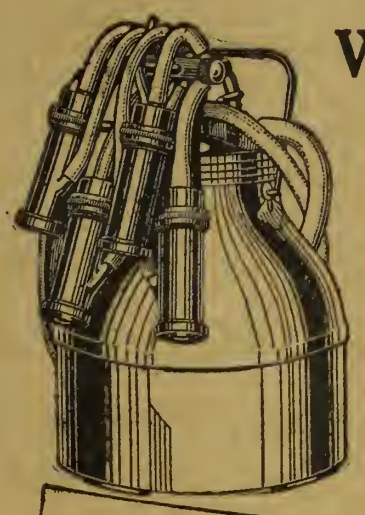
The California farm bureau marketing association reports as to sales recently held in San Joaquin Valley: McFarland, May 24—Toppers were a bunch of 85 averaging 220 pounds, $15.40; another bunch averaging 186 pounds, $15.25; another averaging 178, $14.90; low prices secured by 350 pounders, $12.90.

The Tulare sale on May 25 reached a still higher mark with one bunch averaging 195 pounds, which commanded $15.70; others at $15.40 and down as low as $12.50. The low priced ones, as before, averaged about 314 pounds.

Other sales held at Visalia, Hanford and Porterville were around the same figures, all showing the favorite weights to be around 200 pounds.

The De Laval Milker

What users say



The De Laval Milker was easily installed and the cows took very kindly to the change from hand milking to mechanical milking—all but one, so I sold her.

I milked 15 cows in from 30 to 35 minutes. It would take two men an hour to milk the fifteen cows without a machine. If I had to go back to hand milking at the present time, when it is so hard to get good hired help, I would sell the dairy at once.

A. E. BAIRD,
Valparaiso, Ind.

I was the first farmer in this part of New York State to put in the De Laval, and I bought it without seeing it or knowing anything about the way it operated; but I knew The De Laval Separator Company.

With the De Laval my wife and I milked 37 cows in 59 minutes with the three units and had only a few pounds of strippings.

The Udder Pulsator, with the alternate action and the master control on the Pulsator Pump, is certainly a great idea.

(Signed)
JAMES S. MORROW,
Richville, New York.

The De Laval Milker we purchased in August, 1917, has given us complete satisfaction. During this time it has never failed us.

We have a herd of 50 head of purebred Jerseys. Through indifferent hand milking, the udders of some of these were a little out of shape, but since milking these cows with the De Laval Milker, the teats and udders have improved and all trace of garget has disappeared.

The machine is simple, substantial, reliable and easy to operate. It is being operated by Mrs. Brook, the wife of the foreman.

WALKER'S DAIRY,
Bloomington, Ill.

The De Laval Milker has been in successful use for over three years, milking cows of every breed. It has been used to especial advantage on purebred cows and where certified milk has been sold at advanced prices, and also in A. R. O. work, because of its sanitary, easy to clean features.

Many farmers have installed the De Laval after careful investigation and comparison, which convinced them that it provided the best-known means of milking cows quickly and safely. Its positive, gentle and unfailing action pleases the cows and in many cases induces increased production—at the same time reducing the labor of milking and making it easy and pleasant.

The De Laval Milker is a distinctly different type of machine, positive and uniform in action, and it is faster, more reliable and more sanitary than any other method of milking.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

Poland Chinas

August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J. Elliott and Alex D. McCarty, Tulare.

California breeders will be interested to know that a young bull, King Prilly Segis Alcartra, bred, raised and sold by the Bridgford Holstein Company, Patterson, was recently made first prize senior yearling and junior champion at the Waukesha dairy show. This is but added proof that California Holsteins are ready to go anywhere and meet any kind of competition.

On Monday, May 31, the home of Frank L. Morris on the old ranch of A. W. Morris and Sons, Woodland, was destroyed by fire. The house was a total loss. It will be remembered that last fall the large barn and silos on the same ranch were destroyed by fire. Mr. Morris and family were away at the time of the fire.

Old Man Hardluck continues to camp on the trail of H. P. Slocum & Son, Duroc breeders of Willows. Closely following the loss of their herd boar, Sensation Wonder 1st, they have reported the loss of a junior yearling boar that they have been keeping under cover. This youngster was a very strong prospect for high honors at the fall shows and his death is a severe setback to the operations of the Slocums, but it is safe to lay a small bet that the Slocums will come back—they always do.

The Italian Vineyard Company, Guasti, has 35 young pure bred Berkshire barrows on feed that will be shown in the car lot division at the leading fairs this fall.

W. W. Coates is proprietor of La Pomona Goatery at Watts. There are 30 does in the herd with the fine Toggenburg buck Tyltyl 1402 in service.

R. M. Dunlap, well known cattleman of Sacramento, has just returned from a five weeks trip through the Middle West in search of registered milking Shorthorns for J. E. Jargers of Clarksville. In the shipment were 13 young cows of splendid breeding and proven production. Seven of the cows have calves at foot and a number carry the service of the bull, Dairy King's Cyrus, that will head the herd. Dairy King's Cyrus was bred in Pennsylvania and was sired by the noted May and Otis bull, Glenside Dairy King. His dam, Hattie Belle, is a straight Constance bred cow with a fine yearly butterfat and milk record. According to Dunlap this bull is of show yard caliber. He likewise testifies that the cows are exceptionally heavy milkers and declares that he ought to know, as he acted as milker and left a "milky way" half across the continent. The cattle were unloaded at Truckee, where Jargers maintains his dairy herd during the summer months. Dunlap also brought out a choice yearling Hereford bull for F. H. Scott of Folsom.

Dr. H. W. Hand, well known Jersey breeder of Orland, has decided to retire and has announced that he has entered practically his entire choice herd in a sale to be held in the near future at Salem, Oregon. The loss of Dr. Hand to the Jersey interests of this state will be keenly felt. He has at all times taken a most progressive stand and has assembled a herd of many outstanding cows, including the former world's champion, Goldie's Nehalem Beauty.

Professor Gordon H. True, head of the animal husbandry division of the University of California, has been granted a year's leave of absence in order to regain his health. The last few years have been very strenuous ones for True. During the war he was chairman of the livestock committee of the state food administration, and last year much of his time was devoted to the management of the San Francisco livestock show. True expects to spend part of the summer at his old home in Wisconsin and later go to Hawaii.

Plans have been made public for organizing a Shorthorn calf club at Brown's Valley, Yuba County. This will be the second Shorthorn calf club to be organized in this state. The first was organized last spring in Shasta County by County Farm Adviser Parker H. Talbot.

At a meeting at Willows, Duroc-Jersey swine breeders from all parts of Glenn County organized the Glenn County Duroc-Jersey Breeders Association and elected: F. H. Hurni, Orland, president; C. N. Slocum, Willows, vice-president; C. D. Bright, Glenn, secretary-treasurer; B. Hollingshead, C. N. Slocum, D. F. Small, J. E. Bogue and E. D. Connolley, directors. The new organization expects to stage a futurity show at the Glenn County fair.

Hollywood Farm announces the sale of Hollywood Lilith Adventuress to J. J. Rupp of Tillamook, Oregon, one of the progressive dairymen of that section. Hollywood Lilith Adventuress' six nearest dams average 30.9 pounds butter in seven days. His four nearest dams tested semi-officially, including his own dam's two year old 305 day record, average for 365 days, 850 pounds of butter. His own dam is now on test and is very sure to go over 1,000 pounds, in which case these records will be materially increased. The granddam on the dam's side as a two year old made the wonderful record of 19,954.9 pounds milk and 874.9 pounds butter. The great-granddam made as a four year old 30 pounds butter, and in 365 days produced 891.4 pounds butter from 21,860 pounds milk. This young bull is sired by Hollywood Lilith Palmyra, whose dam produced 1,077 pounds butter in a year from 26,135.9 pounds of milk; also a 32 pound four year old daughter. Two daughters of Hollywood Lilith Palmyra hold state records, one in Washington, the other in California. Half of his daughters show an average of 30.6 pounds butter, at an average of three years. He has one 38 pound, one 36 pound three year old, one 35 pound four year old, and two 31 pound three year old daughters. One daughter, Hollywood Lilith Pontiac, sold in the recent Higdon sale to F. F. Pellisier of Whittier for $1,900. Mr. Rupp's bull has a 31 pound three year old full sister. This pedigree shows extremely heavy production throughout. The fact that Hollywood Farm has kept this youngster for its junior herd sire, until the recent purchase of King Lyons 3rd, who fits the scheme of mating Judge Segis' daughters better, goes to prove what they thought of him. He was not for sale until King Lyons 3rd was purchased.

W. A. Young, Lodi, informs that owing to sickness in his partner's family, he is forced to sell his entire herd of big type Poland Chinas. For a number of years the Young herd has been among the heaviest winners at the state fair whenever shown. Mr. Young is advertising his herd without reserve and expects to soon be an exbreeder. We hate to see this herd dispersed and especially at a time when it would have figured very strongly at any fairs where shown this fall.

One of the most important deals made in Duroc circles was consummated recently when P. E. Thorp, Lodi, sold his yearling herd boar, California's King of Orions, and ten sows to The Boston Land Company of West Haven, for the sum of $4,000. The lot included several individuals. Mr. Thorp expected to show this year at the state fair. However, he will be represented very strongly in the futurity classes.

RICE TO SUMATRA

For the first time in the history of the Sumatra east coast, rice is being imported from the United States, the first cargo of 4,000 tons arriving at Belawan the first week in March. Later shipments of 8,000 tons have been contracted for and are expected to arrive in the spring and early summer. The price paid is approximately $13 c. i. f. Belawan per 100 pounds.

Merci Lad Korndyke Burke

When Buying Registered Livestock

IT IS IMPORTANT that one makes selections from herds, not only noted for the quality and blood lines on which their claim for patronage rests, but it is equally important that one looks to the stability of the herd itself.

FOR OVER 45 YEARS SANTA ANITA RANCHO has existed as a source for the best in livestock and today this ranch stands as a California institution. This fact, aside from the freely admitted quality of the Santa Anita herds and studs, should mean much to prospective purchasers.

FIRST, it means that buyers are getting the cumulative results of a generation of sincere efforts towards better livestock.

SECOND, it assures the buyer a selection from long proven blood lines.

THIRD, buyers can feel certain that they are making selections from herds that will be of increased importance five, ten and even twenty years hence.

FOURTH, because of the character and importance of Santa Anita Rancho activities, buyers are assured of values based on sound and conservative methods.

FIFTH, because it is the established policy of Santa Anita Rancho to lend every possible and reasonable aid to our customers, because it is realized that their success measures our own success.

SIXTH, because it is our aim that the name Santa Anita Rancho as applied to livestock shall have the same significance as the word "Sterling" stamped on silver.

Holstein-Friesian Cattle

In the foundation and development of this herd we have endeavored to select and breed the blood lines that make for real improvement in dairy production, keeping in mind always the individuality to conform most closely to the standards of the breed.

Our female herd contains a large number of daughters of PRINCE GELSCHE WALKER, whose sons and daughters have placed him among the breed's greatest sires, and the public estimate of his blood has been repeatedly demonstrated in the public sale rings of the West, where his sons and daughters, grandsons and granddaughters, have outsold the offspring of any other bull.

MERCI LAD KORNDYKE BURKE, senior herd sire at the head of these females, is a son of the first cow in California to make over 1,200 pounds butter in one year, and she is one of the only two cows in California to make over 31,000 pounds milk in one year.

PRINCE WALKER CORNUCOPIA, the junior herd sire, is by Prince Gelsche Walker, and out of the 36 pound cow Alba Sadie Cornucopia Creetia, who is a yearly producer and of most substantial breeding, being by Sir Sadie Cornucopia, one of the breed's best proven sires.

Both of these bulls are high class as individuals, and their offspring show the inheritance of correct type in a marked degree. No females are for sale, but we are in position to furnish young bulls by these sires and out of high record, well bred dams.

Every Female in This Herd Will Be Given a 305 or 365 Day Record

Poland China Swine

Our registered Poland Chinas represent the most approved breeding and type, the sort that are proving the most profitable producers on Western farms. Orders can now be filled for young boars of most desirable quality.

ROSS

For BETTER Silage--at LOWER Cost. Flywheel and Cylinder Types--and sizes to match your present power--Kerosene, Gasoline or Steam--from four H. P. up.

Ensilage Cutters

HERE'S a suggestion that will mean money in your pocket if you follow it out. Just write, asking "Who sells Ross Cutters in my locality?"

We will send you *facts that will open your eyes* on this silo-filling proposition. We will prove to you that the Ross will not only *save* you money, time and trouble, every fall, but will *earn* you bigger profits every winter by furnishing more succulent, more palatable and more nutritious silage for your stock. We will explain why *the Ross cuts clean always*--keeping the natural juices in every slice of silage.

A one-cent stamp is all it costs to get the facts before you. Your name on a postcard will bring you the story of the simple, powerful, smooth-running and clean-cutting Ross. Write today. No obligation. We'll send Catalog and the name of nearest dealer.

Swine Association Has Program

The National Swine Growers Association was organized in 1914 and was incorporated, not for pecuniary profit, under the laws of Illinois in 1916. It has a membership at present of about 3,500. Membership dues are $5 a year.

The principal function of the organization is the "promotion of the swine industry." Thus far the work has been done in a modest and very conservative manner. The work has had the support of breeders, swine recording associations, swine papers, the agricultural press, state, county and district breeders' organizations, and from some commercial concerns.

As a form of concrete evidence that this association was in favor of a greater cooperation and more complete harmony of the men interested in the hog business, and to further the cause of the right kind of pure bred hogs of all breeds, the annual National Swine Show was inaugurated in 1916 and is being continued with greater success every year. This show is being financed by the breed record associations and the local interests in the city in which the show is held each year. (The show will be held in Des Moines, Iowa, October 4-8, 1920.)

A view herd of about 60 head of hogs will be taken to South America this summer in order to build a stable basis for foreign trade with those countries. This project will be financed by the record associations and breeders of the breeds sent in the view herd.

The railroad claim department of the association is in a position to handle all claims against carriers for loss or damage of hogs in transit. It also offers information relative to rates on shipments, and the handling of claims for overcharge on shipments.

As a whole, the work of the association has given breeders and others information or service which they were unable to get elsewhere. It has been the aim to get correction of laws and regulations which militate against the success of the swine industry; to work for appropriations such as the federal appropriation for the investigation of the soft pork question; to secure adjustment on irregular charges or treatment of members in deals in connection with the industry; to increase and develop foreign trade; and to give publicity through the press to matters of general interest in the swine industry, and to be of general service to hog men and others interested in the industry.

It is now planned to enlarge the work in an attempt to maintain greater stability of the swine industry and to overcome the present difficulties under which hog men are producing and marketing. Many pork producers are now operating at a loss, and have been so doing for some time in the past. This is due, in many cases, to conditions over which they have no control. There have been very violent fluctuations in the market price of hogs which have been very disconcerting. Then, too, lard is selling, for the first time in history, at a lower price than the lard substitutes are bringing, and without any real economic basis.

The plans for the increased work of the association include the collection and dissemination of information relative to the swine industry with a view of increasing pork consumption without injustice to any and with positive benefit to the hog raisers and those engaged in allied industries. There is no doubt but that conditions can be materially changed if the right influence can be brought to exert its power. If the hog business can be made more stable and profitable—and we all know that it has been an almost insoluble enigma in the past few months, or even years—men in allied industries will profit in almost the same proportion as do the hog men.

The overhead expenses of the association are amply provided for at present, and there are limited funds available for constructive work. However, there is a need for increased revenue at the present time if we are to accomplish our purposes and make the association what it should be. If each present member will get one more to affiliate with the association, and if each commercial firm which serves the livestock man will but realize that it is to its interest to further this work—morally and financially—the results will be remunerative to all concerned.

The association and its officers are ready to serve at any time and will always gladly receive suggestions for the good of the swine industry. Any additional information will be cheerfully given by the secretary, W. J. Carmichael, 37 W. Van Buren Street, Chicago, Illinois.

HEREFORD BREEDERS OUTLINE PROGRAM

A special meeting of the board of directors of the Pacific Coast Hereford Cattle Breeders Association was held at the animal husbandry building, university farm, Davis, on Thursday, June 3. At this meeting it was decided to hold the regular fall sale of the association in connection with the California International Livestock Show which it is assumed will be held this year in Oakland, and the regular spring sale will be held during Stockmen's Week at the university farm the last week in February. Steps were taken toward securing the services of a field man for the western territory. It is the aim of the association to put itself in a position for cooperation with other agencies in the matter of the establishment of calf clubs, and the determination was expressed that the white faces should be represented at every county fair in the state this fall. The broad minded and progressive attitude taken by the members of this association toward the problems confronting them as breeders indicates a most rapid and healthful development of Hereford interests on the Pacific Coast. The establishment of at least three new herds in that part of the state which is coming to be recognized as the livestock center of the West was announced.

OAKLAND WANTS A LIVESTOCK SHOW

At a meeting held at Oakland, June 3, at which representatives of many of the livestock organizations were present, as well as a number of the leading civic organizations of that city, plans were discussed that will more than likely materialize in a livestock show to be held at Oakland this fall. Since the indifference of the business interests of San Francisco to aid in establishing a permanent livestock show in that city, the Oakland people have realized the great opportunity and have gone after the show in a way that gives every assurance that they mean business. It is stated that the various organizations of Oakland have agreed to duplicate the prize list offered last year at San Francisco and that an offer has been made to hold the show in the Oakland Auditorium, which is admirably suited for it. The Auditorium is centrally located, is convenient to shipping accommodations and is of ample size.

For a time it was feared there would be no fall show in the Bay section. Apparently San Francisco failed to appreciate the value of such a show to the state and community, and the livestock interests were about to give up hope when Oakland came with an offer. If the show becomes a fact the livestock interests of this state should lend every support and encouragement to those who will make the show possible. Oakland will be a greater city some day because of such a show.

WINSOR BRED SOW SALE

R. K. Walker is enthusiastic over the high quality of some of the youngsters which will be offered at the bred sow sale to be held in Los Angeles, July 28. He writes: "There will be 40 head best spring yearlings and tried sows which have ever left the ranch." They were sired by such boars as Great Orion Sensation, Pathfinder, Orion Sensation and Great Model. These sows will be bred to Winsor's Giant Orion, the largest boar on the Pacific Coast, and part of them will be bred to Giant Sensation 3rd, a son of Giant Sensation on the biggest and best type yearlings in the West.

The two boars represent the best in modern big type Durocs. The results obtained from sows sold in the

sale held last winter by the Winsor ranch justify the belief this sale will be a record breaker. A great many pigs out of the sows sold in last winter's sale will be exhibited at the leading fairs on the Coast this fall.

The Winsor Ranch sale precedes the Conejo sale, which will be held on July 29.

THE ANDERSON SALE OF HOLSTEINS

The Edgemont Holsteins are absolutely to be dispersed. There was a misunderstanding by the printer of the catalogue, and the sale is announced as "Semi-dispersal." Mr. Hughes of the California Breeders Sales and Pedigree Company writes: "This is an error, as the sale will be an absolute dispersal of the herd. Mr. Anderson is offering his ranch for sale and is selling every animal he owns."

HORSE AND MULE POPULATION INCREASING

This estimate of the federal department of agriculture for January 1, 1920, shows an increase of 1,276,000 horses and 785,000 mules over the 1910 census. Besides, from January 1, 1910, to June 30, 1919, 1,149,763 horses and 376,836 mules were exported, and the end is not in sight, for predictions by good authorities are for a steady rise in prices.

SOUTHERN CALIFORNIA HOLSTEIN-FRIESIAN ASSOCIATION

A meeting of the Southern California Holstein-Friesian Association will be held at the Los Angeles Athletic Club on Wednesday, June 16, 1920, at five p. m. At this meeting a permanent orgnaization will be formed and a constitution and set of by-laws adopted. Earl Sturgis of the Santa Anita Rancho will give a report on the meeting of the National Holstein-Friesian Association held at St. Paul, June 3. He will also speak of his visit to the Holstein breeders in the East. There will be a banquet in the evening.

According to H. J. Baade, farm adviser of Napa County, about 100 boys in that county will organize a pig club.

The "Life History" of the IDEAL GREEN FEED SILO

THE ENCYCLOPEDIA AMERICANA, under the subject of "Redwood," says: "It resists decay so well that trees which have lain in the forest for 500 years have been sent to the mill and sawed into lumber."

The remarkable durability of California Redwood is a part of the Ideal Green Feed Silo. Added to it is absolute correctness of design.

The Ideal Green Feed Silo is air-tight, not only through the use of tongue-and-groove staves but because it is also equipped with beveled refrigerator doors which establish a three point contact on all four sides, making leakage at this point impossible.

Strength and stability are gained by heavy, round steel hoops, placed with mathematical precision where pressure is the greatest.

These characteristics are responsible for the long life of the Ideal Green Feed Silo. And because it continues to give profitable service long after it has paid for the initial cost, the Ideal Green Feed Silo accomplishes the purpose for which it was built—real savings.

You are interested in silos for this very reason. An investigation of the Ideal Green Feed Silo will be to your advantage.

The saving capabilities of a silo depend upon how long it will last after it has paid for itself. The Ideal Green Feed Silo is built primarily for year after year of profitable service.

THE FLAG

By Arthur Macy In Youth's Companion

Here comes the flag.
Hail it!
Who dares to drag
Or trail it?
Give it hurrahs—
Three for the stars,
Three for the bars.
Uncover your head to it!
The soldiers who tread to it
Shout at the sight of it,
The justice and right of it,
The unsullied white of it,
The blue and the red of it
And tyranny's dread of it!
Here comes the flag!
Cheer it!
Valley and crag
Shall hear it.
Fathers shall bless it,
Children caress it
All shall maintain it.
No one shall stain it.
Cheers for the sailors that fought on the wave for it,
Cheers for the soldiers that always were brave for it,
Tears for the men that went down to the grave for it.
Here comes the flag!

CAPTAIN HAYDEN'S SUNDAY EXCURSION

By Margaret Condon

IN the three years that John Hayden and Robert Barton had been next-door neighbors they had been warm friends as well. This condition might have continued indefinitely had not Mr. Barton's chayote vine in its erratic wanderings encroached upon Captain Hayden's favorite rosebush.

The Captain, a bluff old sea dog, had brought with him from the bleak coast of New England a love for dogs and a passion for growing roses. His especial pet this season was a beautiful climbing La France, which he had trained on the high board fence between his yard and that of his neighbor. It grew and flourished in a manner that delighted his heart, and when the wonderful blooms opened and the fragrance from their waxy pink petals was borne by the morning breeze through the windows of his sleeping room the Captain was happy.

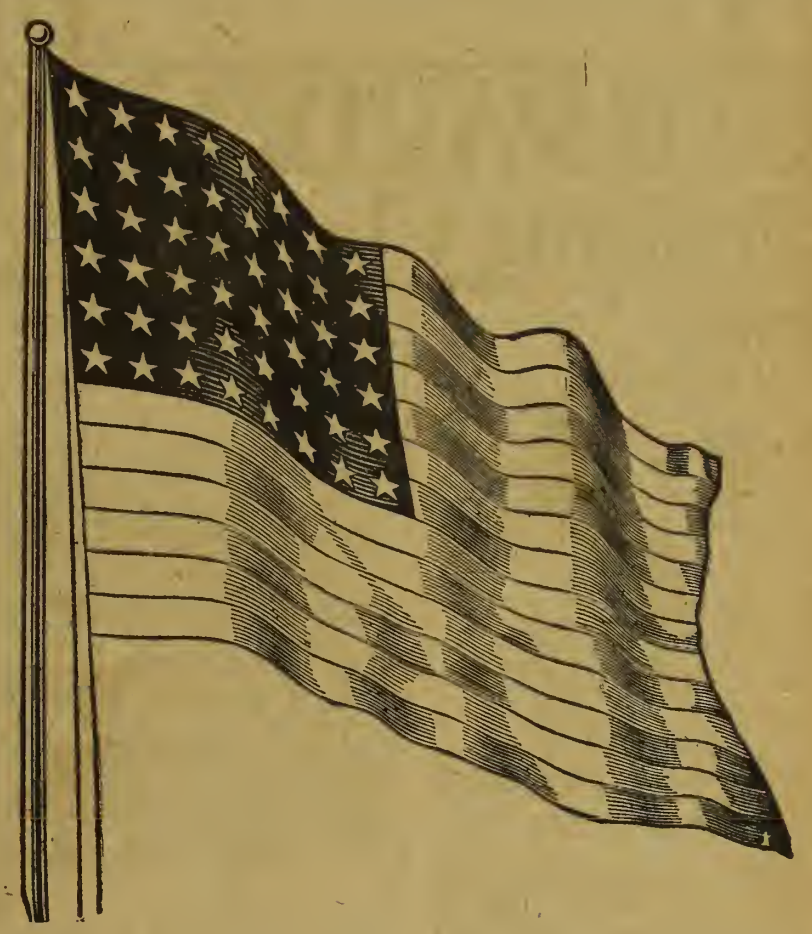
Then Mr. Barton, to checkmate "Old Man Hi," started a vegetable garden. This of itself would hardly have disturbed the even tenor of their way had not some one in an evil moment suggested to Neighbor Barton that the high board fence was an excellent place to train a chayote vine, and the innocent looking gourd with a green sprout at one end, which Mr. Barton planted carefully, gave no hint of the tragedy that lurked in its future development.

The summer was well advanced when Captain Hayden came out one morning to enjoy the sight and fragrance of his favorite hush. For several days the long tendrils from the chayote vine had been annoying him by creeping over to his side of the fence, and he had thrust them back where they belonged, but while he slept they had more than regained the lost ground and some of his choicest roses were now imprisoned in the toils.

"I say, Barton," the Captain called to his neighbor in the adjoining yard, "how much farther is that vine of yours going?"

"Doing fine, Captain, isn't it?" Mr Barton returned, a knowing grin expanding over his countenance.

"Fine!" the Captain snorted, in dis-



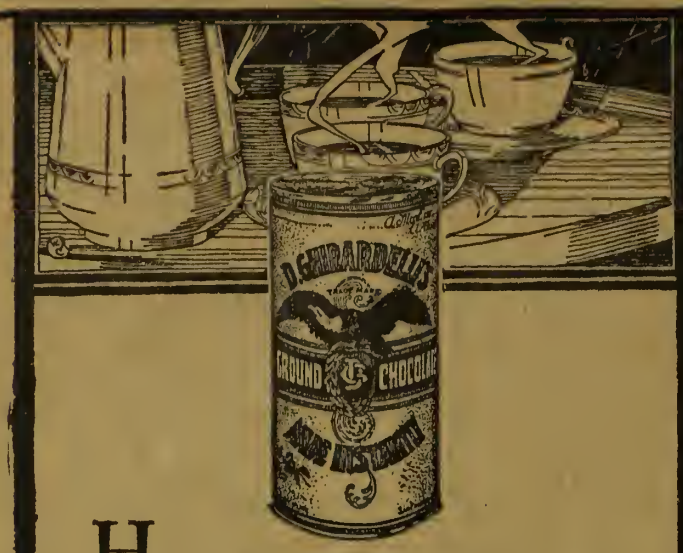
Flag Day---June 14

The Star Spangled Banner

Oh, say, can you see, by the dawn's early light,
What so proudly we halled at the twilight's last gleaming,
Whose broad stripes and bright stars, thro' the perilous fight,
O'er the ramparts we watched were so gallantly streaming?
And the rockets' red glare, the bombs bursting in air,
Gave proof thro' the night that our flag was still there,
Oh, say does that star spangled banner yet wave
O'er the land of the free, and the home of the brave.

On the shore, dimly seen thro' the mist of the deep
Where the foe's haughty host in dread silence reposes,
What is that which the breeze, o'er the towering steep
At it fitfully blows, half conceals, half discloses?
Now it catches the gleam of the morning's first beam,
In full glory reflected, now shines on the stream;
'Tis the star spangled banner, oh! long may it wave
O'er the land of the free and the home of the brave!

Oh! thus be it ever when freemen shall stand
Between their loved homes and the war's desolation;
Blest with vict'ry and peace, may the heaven-rescued land
Praise the power that hath made and preserved us a nation;
Then conquer we must when our cause it is just,
And this be our motto, "In God is our trust."
And the star spangled banner in triumph shall wave
O'er the land of the free and the home of the brave.



HIGH-cost-o'-living has little terror for those wise housewives who appreciate the deliciousness and food-value of Ghirardelli's Ground Chocolate. They find it "rounds out" a meal that, with any other beverage, might seem a bit scanty. For it provides real nourishment—both as a food and as a beverage.

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

Say "Gear-ar-delly"

gust. "The danged thing is all over creation now. Why, man it grows yards in one night."

"Well, what do you expect in California?" was the rather crusty retort. "This isn't New England."

"Keep it on your own side of the fence then," the Captain responded, his wrath beginning to rise.

"I don't see that it's doing much harm, is it? That useless posy of yours takes up a lot of room too," returned Mr. Barton.

Captain Hayden's temper was getting beyond his control.

"Useless, is it?" he growled. "At least it stays where it belongs and doesn't annoy the neighbors. The devil! Look at that!"—as a long green tendril swaying in the breeze reached out under the Captain's nose and uncannily wound itself about a spray which bore several beautiful, half opened La France buds that were just peeping above the fence.

"Look here, Barton," the Captain continued, in emphatic tones, "I warn you I'm going to cut every one of your blooming sprouts that comes above the fence."

"I say you'll do nothing of the kind," retorted Neighbor Barton, getting wrathy in his turn.

"I say I will, and you can go to the devil, sir," Captain Hayden flashed back, and after some further exchange of personal remarks two estimable but childishly angry old men turned their backs upon each other.

In the weeks that followed the chayote vine grew and flourished like the proverbial green bay tree and went straying beyond control of its owner over into Captain Hayden's domain, to be angrily thrust back, often bearing decapitated pink roses in its grasp. The friendly intercourse that had existed between the heads of the two families was a thing of the past, but the destiny that dominates the affairs of men had to be reckoned with.

Robert Barton had a son of 23 and Captain Hayden had a niece a year or two younger, who had developed a fondness for each other. Since the depredations of the chayote vine had disrupted friendly relations the Captain had forbidden his niece, Cynthia, to hold any further intercourse with Fred Barton. But the young people laughed at the attitude of their elders, met when possible, and bided their time. The elder Barton was fond of Cynthia, and prior to the little unpleasantness with her uncle had come to look upon her as his future daughter-in-law. He entered no objection now, but stubbornly refused to make any friendly advances to the grouchy Captain. To all Fred's pleadings for an immediate marriage Cynthia turned a deaf ear, until some way could be found to placate her gruff but kindly old uncle of whom she was genuinely fond.

(Continued next week.)

ETIQUETTE OF THE FLAG

There are many citizens who are not familiar with the rules governing the use of the stars and stripes. To them the following hints on flag etiquette will be of interest:

The flag should not be hoisted before sunrise nor allowed to remain up after sunset. It should not be displayed upon stormy days.

When the flag is displayed at half staff for mourning it is to be lowered to that position from the top of the staff. It is afterward hoisted to the top before it is finally lowered.

When the flag is formally raised all present should stand at attention, with hand raised to the forehead ready for the salute.

When our national flag and state or other flags fly together or are used in decoration together our national flag should be on the right.

When used on a bier or casket at a funeral the stars should be placed at the head. In no case should the flag be allowed to touch the ground.

It is an unwritten law in the navy that the flag is never to be washed; it is always to be considered immaculate.

For indoor decorations the flag can only be used as a drapery; it cannot be used to cover a bench or table, desk or box where anything can be placed or set upon the flag.—Daughters of the American Revolution Magazine.

IF MOTHER IS THERE IT IS HOME

By Kate Price Powell, Highland

The Cultivator household department has received several tributes to "Mother" as the heart of the home from readers who did not see our announcement of the contest subject, wherein Mother and the the family were conceded to be everyone's first choice of the one thing essential to a home. From the contest were eliminated the family, the house, necessary furniture, food and clothing, and we were to discuss the little additional comforts and conveniences dear to our hearts.

Below we give one of these beautiful tributes to "Mother," which will strike a responsive chord in every memory.

The Cultivator page on "Homiest Homes, What Makes Them?" is one of deep interest. I read it today with enjoyment. But may I not add still another word, even though it involves a few personal lines?

When I was a little girl a great day came to our family, the day my older sister was to graduate from college. The family drove to town to witness the event, but my slightly older brother and I were thought too young to enjoy the occasion, so we were sent to spend the day with near by relatives. In the afternoon we grew tired of visiting and so set out for our walk home a little early.

To our dismay we arrived there an hour or so before the return of the rest of the family from town.

I can still remember the surprise and perplexity with which we regarded the comfortable farm house, set round about with giant locusts, which had always been our home. The door was closed, and it was a June day! We opened it timidly and looked in—there was the open fireplace with its wonderful dragons and witches chasing each other across the cool gray panels just below the mantelpiece. There was the easy chair on the side next the clothes press where the mending basket was kept. There was the light stand with the lamp and books and papers, the "singing book" from which a grown up brother taught us tunes and showed us how to keep time with him while we sang "Fair as the morning, bright as the day, visions of beauty fade not away." All, all inanimate things were there, yet we turned and fled into the apple orchard, down to the Red June tree, where we waited until we heard the noise of the family's arrival.

What was it that made home seem strange, and not home? It was because it was the only time in our childhood life that we had ever been there and Mother was not. Father can leave when business calls him; Sister can go away to school; Brother be off on a trip; the place may be rented or owned; children's voices the only music; but if a roof and Mother are there, it is Home—and Mother is the homiest thing in it.

THE HOMIEST THING

By Norma Marvin, Sacramento

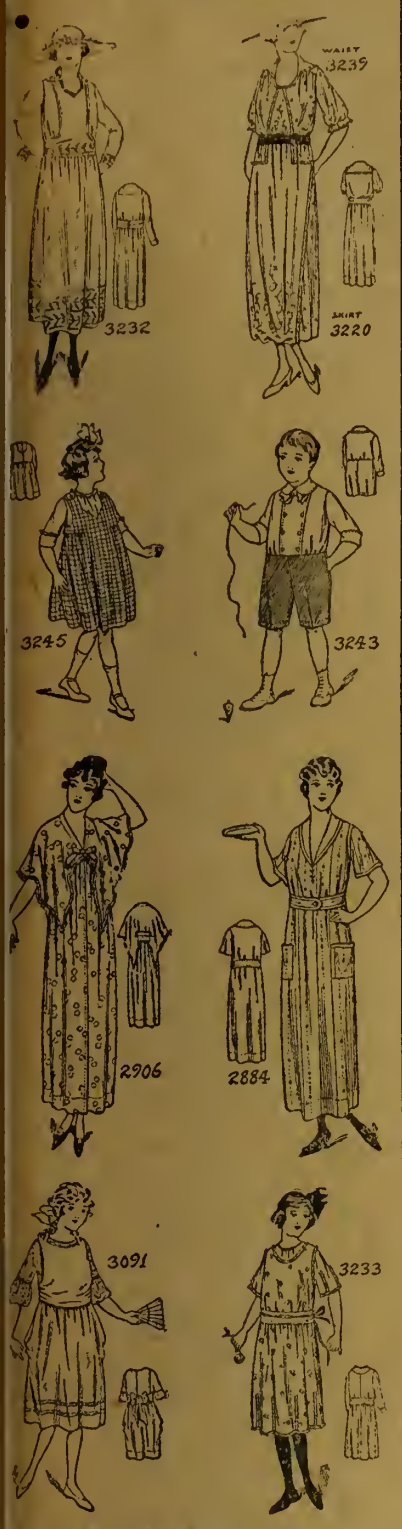
The one thing in my home which I take much interest in and get a great deal of pleasure from is my aunt's cabinet of pretty chinaware. It is in the living room. The whole front of the cabinet is made of glass and it has five shelves which are full of chinaware.

One reason why I think so much of them is because of the curiosity of them. Many of them were given to her by friends. I remember well how she got a cute little cream pitcher that I always thought so much of. My aunt was invited to a sewing bee, and the one that could thread the most needles in a certain length of time was to get a pitcher as a prize, and my aunt won it.

On top of the cabinet is a beautiful cut-glass punch bowl and 12 little cups that go with it. I always like to help shine them when they get dusty. Another odd set she has is a tankard and six steins, each with a different kind of dog's head.

She has a platter and six plates with different kinds of birds on them, and a beautiful hand painted sandwich platter. There are many more things, but I will not mention them. Once in a while we take the dishes all out and dust or wash them. I always like when that time comes. We use the dishes only on holidays such as Christmas, Thanksgiving, or New Years, or on special occasions. Then I like to set the table and wash the dishes. I always think it brightens up the home to see the pretty dishes and shining glass.

The Cultivator Patterns



BE SURE TO SEND SIZE

3232. Misses' Dress. Cut in 4 sizes: 14, 16, 18 and 20 years. A 16 year size will require 5⅛ yards of 36 inch material. The width of the skirt at lower edge is 1¾ yards. Price, 10 cents.

3245. Child's Dress with Guimpe. Cut in 4 sizes: 4, 6, 8 and 10 years. For a 6 year size 1½ yards of 27 inch material will be required for the guimpe, and 2⅛ yards for the dress. Price, 10 cents.

2906. A Comfortable Lounging Robe. Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. Size Medium will require 5¼ yards of 36-inch material. Price, 10 cents.

3091. A Pretty Frock. Cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 requires 4¾ yards of 27 inch material. Price, 10 cents.

3239-3220. An Attractive Costume. Waist 3239 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3220 cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. A medium size will require 6⅜ yards of 38 inch material. The width of the skirt at its lower edge is about 1¾ yards. Two separate patterns, 10 cents for each pattern. Both, 20 cents.

3243. Boy's Suit. Cut in 5 sizes: 2, 3, 4, 5, and 6 years. A 4 year size will require 2½ yards of 27 inch material. Price, 10 cents.

THE HOMIEST THING IN OUR HOME

By Reader, Escondido

We are a family of six, living on a California ranch where all share work and pleasure alike. I think the thing that makes our home the "homiest" is the after supper hour when the family linger round the table and talk over the happenings of the day, tell new stories, or read something especially good and of interest to all. It takes something special to draw the boys away from home in the evening. (We have no girls.) When our eldest boy finished school and went away from home to work, he invariably walked home after supper and stayed until bed time. Now he is in Uncle Sam's employ and writes lovely long letters home from foreign shores, seldom referring to his troubles, but giving interesting descriptions of his work and experiences. These letters are much prized by the family and are read aloud after supper. Although he is thousands of miles away he seems very near at this time. Our pleasant hour usually breaks up with something like this: "Well, come on Dad, let's get our algebra." So while fireplace and music and auto and bathtub all fill a big place, I have a feeling that our "after supper hour" has done more toward "making ties that bind" than all the rest.

PLANT FLOWERS

By Mrs. Wm. Wright, Orland

I, too, remember with a thrill of pride the new piano and the other new furniture with which we furnished our first real parlor. Then the open fireplace, around which the family gathered on cold wintry evenings and made merry as only large families can make merry. But that which above all others I believe brings the air of "home" to a mere "house" is flowers, and by that I mean vines and shrubbery too.

In city or country, whether it be a mansion or cottage, if it be in a setting of flowers and vines it invariably brings forth an exclamation of delight from those who pass by. The hands of man may tend and care for them but we are amazed at the miracles which unfold before our eyes day by day. We are brought to realize that a higher power than mere man first made these things possible.

But all these gifts from God are for rich and poor alike, and no one need be without them for lack of money. So let us plant flowers and more flowers and thus bring peace and contentment to our homes.

THIS WEEK'S PATTERNS

The warm days bring out the cool clothes, and if the supply is short—as it generally is—one begins to think of selecting some cool lawns, pulling out the machine, oiling it and putting it in order and making a dainty dress or two for mother and girls.

3239 is an exquisitely dainty affair of embroidered batiste and lace that any girl or woman would love. Note that it requires two patterns, one for waist, one for skirt, the two costing 20 cents.

The cool looking negligee 2906 with its butterfly cape or collar will make the rest hour a time of dainty delight. Made of easily laundered soft material it will be a joy forever.

3245 is the ever practical guimpe style for little girls. The jumper made of blue and white checked gingham with guimpe of white can be kept fresh and dainty looking very easily.

The pattern 3243 for practical little boy's waist and trousers will be needed to replenish Small Brother's supply of well-worns.

Still another of the Cultivator's practical house dresses is shown in pattern 2884. Easily made, easily laundered, easily worn—try it.

HOUSEHOLD QUERIES

A Flower Hint

Sometimes in arranging iris, gladiolus and other stiff stemmed flowers in vase or jardiniere, they will all fall to one side. It is difficult to find a flower holder with large enough holes or of small enough bulk to fit the case. Here is a solution:

Crush together into a ball a piece of ordinary chicken wire fencing, place in jardiniere and in it thrust stems of your tall stiff flowers. It works! —Cultivator Reader.

1880-1920 **Barker Bros.'** 1880-1920

Fortieth Anniversary Sale
And Annual
Midsummer Clearance

which opened Tuesday, June 1st, with $1,453,000 worth of Furniture and Home Furnishings offered at most decisively lowered prices involving

Savings of 10, 20, 25 and 33⅓ Per Cent

(and even in some cases as much as 40 per cent and 50 per cent)

is a particular Vacation-time opportunity for two classes of Southern California home-lovers to better their homes.

These two classes are: 1, Those who plan to come to Los Angeles to enjoy their annual vacation in the city or at the near-by beaches; and, 2, Those who plan to stay home and enjoy a vacation under the roof of their own home.

Those who come to Los Angeles on their vacation during this Sale and Clearance will find the lowered prices—the savings to be enjoyed on merchandise throughout this store—of such extent and reality that it will be possible in many instances to pay the expenses of their vacation from the savings in cost on their Furniture purchases. Or these savings might mean a longer, better vacation.

Those who will not be in Los Angeles for their vacation this summer, who have decided instead to stay at home and create their own enjoyment by "doing over" some part of their home's furnishing, through a renewal of part of its Furniture, its Floor Coverings or its Draperies, have the same opportunity to save, to enjoy the reduced prices of this sale. It is their privilege to buy by mail at exactly the same favorable sale prices and terms as those able to come to the store in person.

Barker Bros.' Mail Order Department serves thousands every month who find it impossible or impractical to come to Los Angeles. It brings this great, interesting store right to your door—it serves you with the same consideration and courtesy as though you were here in person—it brings you the benefits at this time of reductions in price on more than ten thousand pieces of furniture.

Inquiries by mail have prompt attention the same day as received

Sheep—Ewes, 8.50@9.00; lambs, 14.50@15.00.

POTATOES AND ONIONS

Shippers predict an early slump in potato prices. So far the heavy lots of old potatoes expected have not reached the Eastern markets, being 15,000 cars less than at same date last year. This has kept prices up. But at same date in 1919 but 3,998 cars of new potatoes had been shipped as against 6,145 cars this year. As shipments of new potatoes are daily on the increase it is not thought present prices can hold. Added to heavy receipts the bureau of crop estimates reports an increase in acreage of early potatoes of 52,000 over that of last year, or about 26 per cent. Two-thirds of this increase comes from Virginia alone, and the crop is late, owing to cool weather. But as Virginia shipments will be active by June 15, present prices must tumble.

These are the actual prices obtained between 7 and 8 o'clock, June 8 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk. There may be slight fluctuations during the day's trading.

Potatoes: Old stock, practically no supplies; too few sales to establish market. New stock, market slightly weaker; local Early and White Rose, No. 1's, 2.75@3.25; No. 2's, 1.00@1.90 lug, according to size; cwt. sacked, No. 1's, 7.50@8.00; mostly 7.75@8.25.

Carlots: Old stock: Supplies practically cleaned up. Too few sales to establish market. New stock: Sales to jobbers, mostly 2.75 per lug; sacked, mostly 7.50@7.75.

Onions: Supplies of Wax, heavy; Yellow, moderate; wide range in quality; some slippery; demand and movement slow; market weak. New Stock: Imperial Valley and Coachella Valley: Wide range in prices. Bermudas, best, $1.25@1.50 per crate; lugs, 75@1.00. Crystal Whites, best, per crate, 1.25@1.50; lugs, mostly 75@1.00; sunhurned and decayed at all prices.

Carlots: Demand and movement slow; wide range in condlton; many sunburned; market weak. Coachella Valley. Standard crates, Yellow Bermudas and Crystal Wax; sales to jobbers, best, 1.00; poorer, low as 25.

Garlic: lb., 40.

VEGETABLES

These are the actual prices obtained June 8 by the Los Angeles wholein their sales to retallers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Local packed, 3.75@4.25.

Strawberries: No arrivals. Local: Market firm. Per crate, 3.50@5.00; per tray, 2.00@2.50.

Watermelons: lb., 3½@4.

lliberal. California Navels, best brands, packed, 80's to 100's, best, 4.00@4.75; 126's to 150's, best, 5.00@5.50. Local Market: packed, 80's, 3.50; 96's, 4.00; large sizes, low as 2.25; lugs, culls, mostly 1.50@1.75. Valencias: Packed, special brands, 5.00@5.50; local packed, 3.75@4.25.

HONEY

Demand exceeds supply, movement limited, market higher. Old honey practically exhausted, new supply not on market for about two weeks. Carloads f. o. b., usual terms. Light amber sags per pound, 18; light amber alfalfa, 17. Beeswax, l. c. l. lots. 40@42.

BEANS

California Lima Bean Growers Association:

There is not much new information relative to the lima and baby lima bean market, with the exception of a very small amount that may be returned as unused seed. The baby limas are completely sold nearly two weeks ago, although part of these sales were for last of June shipment. The selling of the last of the baby limas has not appeared to materially stimulate the market price.

The association's price on regular limas has for two weeks past been on the basis of 12 cents coast, with 12 per cent bonus in beans, or equivalent to about $10.71 per hundred weight, f. o. b. coast. Sales were very free during the last half of May with the expected result of lighter demand during the first week of June, but buying still continues and the stocks have not been reduced to a point where it seems certain that all will be sold and shipped before harvest time.

HAY

Quotations by Nichols-Loomis Company. Following are prices to growers t. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	25.00@27.00
Barley	18.00@20.00
Alfalfa	23.00@27.00
Barley Straw	8.00@10.00

Alfalfa Growers of California, under date of June 9, say:

"The market for alfalfa hay this week continued firm with very good demand at full previous prices for spot lots, while prices for shipment within 30 days advanced fully $2.00 a ton; they are now almost up to the prices for spot lots.

"We referred in our last week's report to the tendency among growers in many parts of the state to reduce their alfalfa acreage in favor of better paying crops. That this tendency is not confined to California is evidenced by a press dispatch from Pheonix, Arizona, a few days ago, telling of the shrinking of alfalfa acreage and of the serious plight into which the dairy industry of Salt River Valley has been thrown by the spread of cotton growing. The article then gives particulars about the closing down of the largest creameries there on account of the inability to secure the milk supply from a valley that, only two years ago, had 60,000 milk cows, most of which are now gone.

"We have been asked to state the position of the Growers Association in relation to the hay dealers. The association is not antagonistic to the dealers; these middlemen are necessary as distributors of the hay and the association has no intention to attempt displacing them by undertaking the retail distribution, excepting in so far as existing local conditions make it logical and necessary to do so.

"The dealers, in order to be able to carrry on their work of distribution successfully, are of course, entitled to a corresponding profit and the association does not begrudge them this profit as long as the grower also gets a square deal on basis of live and let live. We believe that the middleman is an enemy to the grower only when he is fattening himself by starving the grower and even then the dealers as a class, are probably not as much to blame as is the competitive system to which we are all subject; this system compels the dealer to buy as cheaply as he can regardless of cost of production, in order to meet competition. and it is therefore, the task of an association like ours to prevent that grower from being the helpless victim of these conditions."

Prices on hay in southern districts:

Los Angeles prices as named this week:

Rabbit Alfalfa	38.00
No. 1 Dairy	33.00
Standard	30.00
Stock	28.00

GRAIN AND FEEDS

Price bid local grain exch. cwt., June 8:
Barley: Carlots, 2.72@2.75.
Milo: 2.70@3.11¼.
Wheat, mixed feed: Utah-Idaho, 6.20.

San Francisco Markets

San Francisco, June 8, 1920.

BUTTER

Quotations made daily by the San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

BETTER SHORTHORNS

Among Shorthorn cattle breeders there has been a general effort to obtain still higher class bulls, the purpose being to produce still better Shorthorns. Already the results are in evidence and next year there will be a more marked improvement. Price hasn't been considered. The best this country affords and the best obtainable in the British Isles have been secured. Shorthorn men are getting ready for a world-wide demand which is in prospect.

Pears:
Standard 20, choice, 22½; extra choice, 24; fancy, 26@27.

WALNUTS

Net prices have been named by California Walnut Growers' Association.
No. 1, 31½.
No. 2, 26.
Diamond Brand Buds, 34.
Golden State Buds, 34.
1918 No. 1 price was 28; fancy budded, 31½.

BEANS AND PEAS

California Bean Growers Association, San Francisco, June 1:
For the past month the general market for California beans has been quite active, although within the last ten days there has been a slight cessation of buying, due principally to the unsettled condition of the money market. The banks have again increased their interest rates and are not making loans for speculative purposes on any food products. This has had the effect of preventing eastern buyers from purchasing for August and September shipments.
Michigan beans are selling at $8.00 f. o. b. Michigan and there is every indication that this price will remain firm as their stocks are not large and will be moved before the new crop comes in.
There is a general feeling that in August and September there will be a heavy demand for California beans, as it has become pretty generally known that the 1920 crop is likely to be unusually short on account of decreased acreage planted.
Kotenashis have been held fairly strong until the past week when several of the importers who had sold short endeavored to break the market by offering out at low prices and not confirming. Kotenashis are selling at the present time at $5.15 to $5.25 in bond, San Francisco.
California beans are being offered at the following prices for shipment:

Large Whites	6.30@ 6.60
Small Whites	6.00@ 6.25
Mexican Reds	9.00@ 9.50
Red Kidneys	14.00@14.50
Bayos	10.25@10.50
Blackeye	8.25@ 8.50
Pinks	6.50@ 6.75
Cranberries	6.50@ 7.00

Dried Peas: California, 5.00@5.25 cental.
Lentils: California, 11@11½ per lb.; Chile, 12 per lb.

HOPS

1919 crop, 1.00@1.05 per lb. Prices to growers for 1920 crop, 75@80 per lb.

HONEY

Old crop is scarce and hard to quote. New white orange extracted is 21, f. o. b.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

	Per Bus.	Per Cen.
Hard White—		
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51½
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.58
No. 3	2.00	3.48 1-3

The above are minimum prices.
For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.
Oats: Red feed, 3.10@3.20.
Corn: California yellow, 3.70@3.75 per cental; Egyptian white, 4.25@4.35; California milo maize, 3.45@3.50; Eastern milo maize, 3.15@3.25.
Barley: No. 1 feed, 3.00@3.10.

HAY

Under date of June 5, Scott-Magner, Miller, say:
Miller, say: Receipts past week, 749 tons. Receipts have consisted principally of old grain hay and new alfalfa. The car situation is bad, there being a shortage noticeable already. Railroad authorities say there is no prospect for some time to come of anything other than severe shortage of cars. Cutting and baling is progressing in nearly all sections and considerable grain has been cut for hay in some places through the fear that it might not fill if left for grain. This will materially increase the amount of hay on hand when a general summary is taken. Very little general buying has been done, farmers holding for prices far in advance of most dealers' and consumers' ideas for new crop. New first cutting alfalfa probably will be ready for market within the next two or three weeks. First cutting has been practically disposed of. We are only quoting old crop as yet because the new crop has not come to hand. During the coming week some will probably come to market and quotations will be made. Country trade is practically nominal as most districts have more or less local hay which is traded before buyers come into the open market for supplies.
We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Fancy wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat and Wheat and Oat hay	35.00@38.00
No. 2 Wheat and Wheat and Oat hay	32.00@35.00
Choice Tame Oat hay	37.00@40.00
Wild Oat hay	Nominal
Other Tame Oat hay	33.00@37.00
Barley hay	Nominal
Alfalfa hay new	25.00@30.00
Alfalfa hay, old	30.00@32.00
Stock hay	29.00@32.00
Oregon Cheat and Oat hay	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Citrus Markets

Los Angeles, June 8, 1920.

Valencias are commanding a higher price and meeting exceptionally rapid sale. There is an occasional car of Navels still offered. These are usually pulled from cold storage.
Grapefruit is keeping badly and commanding exceptionally low returns. Lemons are bettering slightly.

Shipments

Shipments to date from Southern California since November 1, 1919: Oranges, 20,848 cars; lemons, 4,755; total, 25,603. To same date last season: Oranges, 2,4106; lemons, 6,130; total, 30,236. From Central California to date this season: Oranges, 5,338; lemons, 288; total, 5,626. To same date last season: Oranges, 3,590; lemons, 251; total, 3,841. Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

MARKET NOTES

Commercial acreage of early potatoes in the United States, as reported by the bureau of crop estimates, shows an increase of about 52,000 acres, or approximately 26 per cent more than last season. Two-thirds of the increase is supplied by larger planting in Virginia. The crop in that state and in Maryland is backward on account of cold, dry weather, and movement will probably not be active until after the middle of June. The estimate for 1920 of 253,037 acres is above normal as compared with an average crop of 234,940 acres during the previous five years.
Onion markets in cities of the East and Middle West are heavily supplied. Bureau of markets reports under date of June 8:
Eastern markets, weak and unsettled, and the general price range lost about 75 cents to a close of $1.25-$2.00. Middlewestern markets dull and weak, losing 50 to 75 cents, closing at $1.00-$2.00 per standard crate. Sales to California shipping points were at $1.15-$1.50 per standard crate, carloads f. o. b., cash track, with demand poor. Values in consuming markets ranged $1.50-$2.25. The heaviest movement is from Texas, and is slightly below 500 cars per week. This is about twice the rate of movement from California. Indicated total acreage of onions is 40,160, compared with 39,785 acres last year."

MORE AND BETTER POTATOES

The potato growers of San Bernardino County recently met at the farm bureau office and organized a San Bernardino Valley Potato Growers Association to operate under the auspices of the San Bernardino County farm bureau. As to marketing the crop, arrangements were made to handle entirely through the California Vegetable Union. Other organizations affiliated with the marketing association are the San Gabriel and San Fernando Potato Growers Associations and the association at Shafter, Kern County.

The laborer is worthy of his hire

All service is worthy of its hire and good service cannot be continuously obtained unless adequately rewarded.

From the beginning of telephone history the American public has received the best telephone service of any country in the world. In proportion to the service rendered the people have paid less for this telephone service than any other country in the world.

The reason why the American people have received the highest type of telephone service at the least proportionate cost is because the Bell System has been operated on a scientifically economic basis.

Every device which inventive skill, engineering ability, labor and time saving talent has been able to create; every efficiency known to buying, operation, executive control and financial conduct has been employed.

Public service companies feel the high cost of living as well as individuals. Pay them enough to make possible their giving good service. There is no permanent saving in poorly paid service.

In this land of opportunity none of us is willing to jeopardize his success or happiness by stinting the payment necessary to secure the most healthful and efficient service.

It's the Cockerels That Count

By Jean A. Koethen

PEDIGREEING cockerels, Mr. James Keppie believes, is the only way to make progress in building up a high producing strain of fowls. Mr. Keppie is manager of the Waldeck Ranch at Burbank, and has spent 16 years studying the principles of breeding, 14 at Petaluma and two in Burbank. For a time he was associated with Walter Hogan, and while he acknowledges that the Hogan system has its merits he will not admit for a moment that it can take the place of trapnesting.

Trapnests Pullets Only

On the Waldeck Ranch all promising pullets are trapnested for a year. A year's record is considered sufficient and the pullets that make good during the pullet year are put into the breeding pen at its close. Last year all pullets averaged 180 eggs for the year and 115 eggs for the first six months. The highest hen laid 282 eggs in 12 months.

A hen is expected to do more than half her year's laying the first six months. Hen No. 8, the highest pullet, and the one that reached 282 eggs by the end of the year, laid 160 eggs in six months. Hen No. 78 laid 139, Hen No. 32, 129, and Hen No. 23, 131 eggs.

Pays to Trapnest

Five hundred pullets hatched last March (1919) were in the trapnest house the day I was there, and 800 hens that had made their record last year were in the breeding house. The income from these 800 hens for March and April was $30 per day, an average of $1.12 per month for each hen. This income was not from commercial eggs but from hatching eggs at eight cents apiece. Thirty-five thousand chicks were shipped the past season.

Hen Hatched Cockerels

All cockerels intended for breeders are hatched under hens and a special yard is set aside for the 80 Rhode Island Red mothers. Male birds hatched and brooded by hens show stronger vitality than those hatched and reared artificially. The difference may not be apparent at first, but the hen hatched males hold out better and are in better shape at the end of the season. Incidentally the hen raises a larger per cent of the chicks hatched. On the Waldeck Ranch 96 per cent of the hen brooded chicks live to maturity, as against 85 per cent of those artificially reared.

All eggs from hens that have laid 260 eggs or over during their pullet year are hatched under hens, and the cockerels are kept for the breeding pen. These cockerels are mated to the high record hens of the year before and the daughters are expected to show higher fecundity than their mothers. In order to effect real improvement Mr. Keppie believes high producing mothers as well as pedigreed cockerels should be used. Mating these pedigreed males to low producing females will never raise the standard of the flock.

In order to secure cockerels of still better pedigree eggs were bought this year from the Tancred ranch in Kent, Washington, at $30 per setting. The cockerels from these eggs will be mated to the highest record hens from the hatch of March, 1919.

Clabbered Milk for Chicks

Two cows are kept mainly to supply the little chicks with sour milk. This milk, when it is clabbered, is put before them in water fountains and is kept before them every afternoon from the very first. A commercial chick mash is the first feed. After four days on mash commercial chick grain is placed before the chicks, but whatever else they have, they always have milk. No moist mash is fed to chicks, but the older hens are given during part of the season a mash moistened with milk. Breeders receive dry mash only

Wide Ration for Breeders

The mash kept before the breeding stock has a wider nutritive ratio than that given the layers. One commercial mash is bought for all, but to this laying mash is added about eight per cent oat chop. This addition reduces the proportion of animal food to ten per cent, which is high enough for breeders. Eighteen per cent is allowed the layers.

Kale for Greens

The main difference between poultry methods in Petaluma and those in Southern California, Mr. Keppie says, is that in Petaluma kale is the main dependence for green feed while in the south barley and alfalfa are relied on. Mr. Keppie brought his Petaluma habits with him and finds a half acre of kale will feed his 1,500 hens, even in this dry land. Of course it has to be watered well, one good irrigation monthly, not just a sprinkle, but a regular citrus irrigation, four days running. This, with all the manure from a horse and two cows, keeps the kale growing and brings it often to a height of six feet.

Menu at American Egg Laying Contest at Kansas City

By Russell F. Palmer

To make poultry pay in these days, it is important that every ounce of feed be assimilated and put to work profitably by the hen. Feed for laying hens should contain certain proportions of grains and animal feeds to insure the possibility of hens turning it into an equal number of eggs yolks and egg whites. For example, if we feed a mixture so proportioned that the hen can turn it into ten yolks and only four whites, she could ony manfacture four complete eggs. The feed she consumed that made the extra six yolks would be wasted. She would absorb those extra yolks into her system, usually causing her to become overfat inwardly. This condition will shorten her activity as a layer, and loss is sure to result.

From time to time we have told how to mix and proportion a balanced ration of scratch and mash feed to insure increased egg production. We realize there are thousands and thousands of poultry raisers living in towns and cities with whom it is unprofitable and impracticable to purchase raw products in large quantities and to even attempt to mix their own feeds.

For this reason we made a careful study and careful tests of different manufactured feed. This year in the American Egg Laying Contest we are feeding a mash feed manufactured by the Blatchfords Calf Meal Factory. From November 1 to May 1 this mash has been used and results to date are more than satisfactory.

We keep this mash continually before the hens in self feeding hoppers. At noon a moistened mash is given in clean troughs. Care is taken not to provide more moistened mash than the hens can easily clean up in 30 minutes. The same mash as that provided in dry form is used, except that it is moistened with hot tea made by steeping dry alfalfa or clover leaves. One hour before roosting time we scatter a mixture of hard scratch grains into ten inches of dry litter. We provide about one and a half pint to each 12 females for supper, and afterward we scatter one pint of the scratch grain in the litter for each twelve females for the early breakfast the next morning.

By placing the breakfast grain in the litter at night we find it induces the habit of vigorous exercise early in the morning. This is good for them.

About 10:30 each morning we feed one inch square of green succulent feed to each female. This is a great help toward good physical condition and keen appetites.

In ten pens 50 hens produced a total of 5,955 eggs during the six months of

time from November 11 to April 30. These particular six months are the months including our coldest winter and our windy and rainy periods. This is an average of 119 eggs per hen for the first six months of their laying year.

Beginning early in June every yard will again be limed, plowed, and sowed to oats, rape, rye or wheat. We will keep the hens off these yards for ten days to two weeks until the seed has made a growth of six to ten inches.

Every house will be thoroughly cleaned, scrubbed, and very thoroughly sprayed with a solution of crude carbolic acid and coal oil. This treatment is given to the floors, walls, ceilings, nest boxes, dropping boards and every bit of interior equipment.

Particular attention is given to the house ventilation system, windows will be opened wide and every thing possible done to increase the changing of air within the house. More harm often results from hot weather and warm, impure air than from the coldest weather.

The following tables are records of the ten highest pens for six months: S. C. White Leghorns, Texas, 671 eggs; S. C. White Leghorns, Pennsylvania, 653; Rhode Island Whites, Kentucky, 611; White Wyandottes, Pennsylvania, 607; S. C. White Leghorns, Iowa, 587; S. C. White Leghorns, Missouri, 582; White Orpingtons, Ohio, 578; S. C. White Leghorns, Washington, 566; S. C. White Leghorns, England, 563; S. C. White Leghorns, Illinois, 557.

Ten highest pens for April: S. C. White Leghorns, Michigan, 129 eggs; S. C. White Leghorns, Kansas, 120; S. C. White Leghorns, Ohio, 118; Rhode Island Whites, Kentucky, 118; S. C. White Leghorns, Kansas, 115; S. C. White Leghorns, Ohio, 116; S. C. White Legborns, Texas, 109; S. C. White Leghorns, Iowa, 108; S. C. R. I. Reds, New York, 108; S. C. White Leghorns, Pennsylvania, 105.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, May 31, 1920. Report for the week ending May 28, 1920:

The agricultural college at Storrs has announced the tenth annual international egg laying contest to begin November 1. Before the announcement was made, however, the management of the contest had already received applications for 20 per cent of the available pens from breeders in Connecticut, Rhode Island, Massachusetts, Vermont, New York, New Jersey, Pennsylvania, Ohio, Illinois, Michigan and British Columbia. Rules and regulations that will govern the tenth annual competition are now nearly ready for distribution. Meanwhile it may be added that the college intends to follow its usual custom of considering the old contestants preferred applicants until the first of August.

In the thirtieth week of contest now running Jules F. Francais' pen of Barred Rocks from Westhampton Beach, Long Island, was not only an easy first, but these ten birds, with a yield of 65 eggs, tied the highest weekly record of the year.

With the exception of the Rhode Island Reds the leading pens in each class are so close together that a let-up for a fortnight, or in some cases for even a single week, is likely to lose the best pen its place. Thus among the Plymouth Rocks the second best pen is 31 eggs behind the leaders. In the Wyandotte group the second pen is only 16 eggs behind. In the Leghorn class there is a difference of 38 eggs between the two best pens.

The three best pens in each of the principal varieties are as follows:

Plymouth Rocks

Jules F. Francais (Barred), 1,265; Oneck Farm (Barred), 1,234; Merritt M. Clark (Barred), 1,132.

White Wyandottes

Mrs. R. W. Stevens, 1,039; Herbert L. Warren, 1,023; Applecrest Farm Company, 996.

Rhode Island Reds

Pinecrest Orchards, 1,255; Charles H. Lane, 1,130; Jacob E. Jansen, 1,125.

White Leghorns

George Phillips, 1,219; Glenhope Farm, 1,181; E. A. Ballard, 1,141.

Miscellaneous

A. L. Anderson (R. I. Whites), 1,152; A. E. Hampton (Black Leghorns), 1,111; H. P. Cloyes (Buff Wyandottes), 1,024.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

By Max Kortum

For the past seven days ending with Saturday May 29, the contest flock averaged 61 per cent in production. In considering this average a person should bear in mind that it is based on a flock from which there has never been any culling. According to the present record sheets the contest is carrying 34 hens that are not laying. Some of these are real culls that would, under ordinary circumstances, be discarded; others are moulting and broody. The hens that are laying are producing as an average within a fraction of 70 per cent.

Pens laying 70 per cent and better for the week are: Gibson, 53; Barker, 53; Bellows, 53; Enterprise, 50; Wilson, 50; Gibson, 50; Stalling, 50; Rose, 49; Amsbaugh, 49; Tullet, 49.

FEEDING YOUNG TURKS

In "Turkey Problem from a New Angle," given in the Cultivator of May 22, Mrs. Koethen outlined method of feeding, using special johnny cake and reducing usual amount of greens, feeding no sour milk whatever. This has caused a Cultivator subscriber, Mrs. J. L. B. of Sonoma County, to give her method of feeding turkeys. She writes:

I am an enthusiastic turkey raiser and have had much success, raise nearly every turk I hatch. I wish you would print my way of raising turkeys which is the simplest and I think best. Mrs. Koethen says "no sour or clabbered milk, very little grain." I now have 43 little turks nearly two months old from 45 that were hatched, and my little turks are raised only on clabbered milk warmed till it becomes cheese, chopped onion tops and lettuce three to four times daily, all they will eat up. Now I have them on scratch feed, cheese, chopped onions and lettuce in the morning, cheese and chopped lettuce at noon, chopped lettuce and scratch feed at night. My turks are strong and healthy looking and we certainly do get some very severe winds in this valley of the moon.

My turkey hens hatched my poults and when all were hatched I gave the whole 45 birds to two mother turks and the other has gone to laying and setting again. I expect her second batch next week.

I have a large coop of wire to accommodate the two mothers out in the open with a large canvas on the windward side over the top and around. In front is an opening in the wire large enough to let the little poults out to run on an alfalfa patch and I feed poults separately from the mothers. The mothers get scratch feed and greens only. I use about five gallons of skimmed milk weekly for my poults and I have hundreds of heads of lettuce and my own raised green onions, so you see how cheaply I raise my stock. When the poults are large enough to be taken from the mothers I am going to turn them into a large grain field which will be threshed this summer and the cost of raising my stock is indeed very small.

I've raised turkeys for three years only, hatched and raised eight the first year, bought the eggs from a friend and set them under a turkey hen. That gave me my start as I traded one of my young gobblers with a neighbor so I did not inbreed and last year changed again.

The field work for the gravity irrigation project in the Parker Indian Reservation on the Arizona side of the Colorado River, which has been going on for the past six months, has been completed. This will provide for the irrigation of 115,000 acres of land and the complete plans will be submitted to the department of the interior about July 1. The work of enlarging the canals of the present pumping system at Parker and the construction of new waterways to supply the additional 6,000 acres recently released to white settlers is advancing rapidly, and it is expected that the work will be completed by July 1.

Cotton growers in the Salt River Valley report a new trouble, which is designated as "sore shin." Fortunately, it is not probable that this disease has resulted in very much damage to the crop.

Lactein
—for Growing
CHICKS

During the period of growth the chick is in its most important stage, and in this time is molded its future, either as a producer or a drone. Healthy, sturdy chicks make the producers—and the feeding of LACTEIN STIMULATES the organs, keeps the system thoroughly cleansed and supplies the LACTIC ACID in just the right proportion to tonic the growing chick and also furnish the food value that means so much.

¶ ¶ ¶

Go to your dealer today and get LACTEIN—and after you have given your poultry this diet for about six weeks, you'll notice the beneficial results. And you'll never be without it.

Start now with this scientific, pure food and tonic for poultry and hogs. It is your best investment for profit.

FISK TIRES

TIRE SUNDRIES

CHICOPEE FALLS, MASS.

PLEASE ADDRESS REPLY "ATTENTION OF

TO THE CAR OWNER:

Do you know that we have an unusual tire that may be of special interest to you?

There are some who do not want a tire of the standard grade and who do not want to go to the cost of a Cord - something between the two. For those we have a truly distinctive tire in the Fisk Red-Top.

This tire is generously oversized, has an extra ply of fabric with an extra heavy tread, all of which gives exceptional strength and endurance. Its attractive color gives it a distinction which the discriminating buyer likes.

The use of this tire when an overload exists will prove its economy. It is made in the popular sizes only, up to and including 4½". It is the best fabric tire made and its slightly added cost over the standard fabric tire will be money well spent.

Tell your dealer you want to buy a Red-Top if you do not want to go to the expense of a Cord. All dealers will be glad to supply you and our chain of 140 distributing houses assures you of fresh stock from your dealer.

Very truly yours,

E. H. Broadwell

Keep Out the Ills We Know Not Of

WE once heard an attendant at a state fruit growers convention express heart-felt thanks that there were scale and other bugs infesting orchard trees because of the fact that it took energy and hard labor to control and keep them down and this gave to the energetic fruit grower a certain advantage over the shiftless or indifferent. Hence, good return because of insect pests.

This type of reasoning may be satisfactory to some but the millions of dollars required to purchase supplies, to purchase labor, and to pay for inspectors to see that the labor is applied at the right time and in the right manner all make a terrible drain on the industry. What is more, the producer of poor fruit or a poor product of any kind instead of being an advantage to the producer of good fruit, is a menace and a disadvantage to the industry. Hence, not only standards must be kept up but methods of work must improve.

There was a time when "Conscience did make cowards of us all," and we decided to bear the ills we had—even welcome others we knew not of. Now it's different. Prevention through quarantine is universally recognized as essential to the producing industry. There are most disastrous insect and fungous crop enemies clamoring at every port of entry. California and the Pacific Coast have lead in the fight to keep these pests out. National quarantine now established and under direction of Dr. Marlatt has done most effective service. Some importers have been injured, more have feared they might be and have opposed quarantine measures, but the interests of the industry are greater than individual interests, even greater than the advantage which is secured by the introduction of new forms of plant life, from every part of the earth.

Growers and nurserymen on the Coast are unanimous on "Keep 'Em Out." There is a strong Western Plant Quarantine Board. All western states united. Director Hecke at the recent annual convention made an address from which we quote:

"To those in our western states who would question the necessity and ultimate value of our plant quarantine work, I say: Lift your mental vision over the Rocky Mountains and consider the calamity that has overtaken the forests, farms and fields of the great territory that reaches to the Gulf of Mexico and to the broad Atlantic, a part of our country that did not until very recently attempt to protect its crop producers by the exercise of proper inspection upon arrival, and which now finds itself in the grip of several drastic federal quarantine regulations. There is blister rust in the pine woods, gipsy moth, brown-tail moth and chestnut bark disease creating havoc in the hardwood forests, potato wart in Pennsylvania, cotton boll weevil busily at work in practically all cotton fields, pink bollworm in Texas and Louisiana, European cornborer in Massachusetts, New Hampshire, New York and Pennsylvania, Japanese beetle in New Jersey and the Oriental peach moth well established in Massachusetts, New York, Connecticut, Pennsylvania, New Jersey, Delaware, Maryland, Virginia and the District of Columbia. All these are introduced crop pests, all constantly spreading, causing onerous local quarantine restrictions, necessitating enormous annual appropriations, and each season, every season, taking an increasing percentage of the growing crop and of the crop producers' anticipated profits. No one of these miserable crop destroyers is yet established west of the Rocky Mountains; no one of them can reach here through its own powers of locomotion, and it should be the fixed purpose of all plant producers and equally with all plant quarantine officers, to circumvent any attempt to assist in their emigration.

"The formidable list of pests just enumerated—all of which constitute a constant daily menace—should be a warrant for renewed efforts upon the part of the western plant quarantine board to prevent their introduction into our territory, and as an appeal to the legislative and commercial bodies of our several states for support and cooperation in this work of protection to our crops, and prevention of the burdens of plant quarantines.

"Active cooperation with the United States department of agriculture, particularly in the execution of quarantine regulations, has developed into a recognized part of our local state work, and has proved of incalculable value to the state of California. Under this cooperative system all our quarantine inspectors have been made 'collaborators' of the United States department of agriculture, vested with full authority to execute all the provisions of the numerous federal plant quarantines and paid by the federal government for this cooperative work."

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

HELP BUD SELECTION

The Bud Selection Association may be given material help in its present campaign to advance horticultural interests of California. Naturally the best of every kind of fruit grown in California is desired. Nearly every community has an outstanding orchard or an outstanding tree which would add greatly to the state's prosperity if its high producing quality could be transmitted or passed on to other orchards and other communities. This can be done if the information is given to the association which is looking for the best and biggest producing trees in the state.

PREPARE FOR THE WET

There is a wet time coming. This is a drying state. Thousands of tons of fruits and vegetables are dried annually. Every year will see material increase. Unfortunately, the drying season sometimes runs over into the wet, as was the case some two years ago when one of our largest fruit drying sections experienced a seven inch ten day long rainfall. The loss was millions for there were no dryers, dehydrators nor evaporators to help meet the situation. Prof. Cruess' article on Page 977 is filled with suggesetion. A post card to manufacturers of these appliances will bring other information and show how the commercial interests are endeavoring to aid in solving one of California's fruit problems.

GROWING

California is growing as never before. We are all wishing the census had come a year later. However, it will, ten years later, and we believe our growth will be as great during the next decade as it has been in the past. The total for the state will not be available for some little time. Some of our cities are being given approximately correct figures as to their totals. San Francisco shows a gain of 21.9 per cent, with a total of 508,410; Pasadena, 45,334, an increase of 49.7 per cent; Fresno, 44,616, an increase of 49.2 per cent; Stockton, 40,296, an increase of 73.3 per cent; Long Beach, 55,593, to which it was increased from 17,809 ten years ago. This makes Long Beach the banner winner with nearly 300 per cent. Los Angeles also has a comfortable feeling with a total of 575.480, or an increase of nearly 80.3 per cent, the greatest increase of any city of its size.

Census Supervisor Dodson reports that 10,000 of this increase was due to extension of territory. Still the increase of the same territory as the 1910 census is nearly up to 80 per cent. Los Angeles at the time of the 1910 census was the 17th city of the United States. She is now the tenth city.

PAGE 1000

To the household department comes the honor this week of "page 1000." For the first time in its history the California Cultivator gives to its readers considerably over the 1000 page mark in the one volume covering a period of six months. Next week's issue will complete the volume LIV. If the remaining six months should give an equal number of pages the Cultivator would supply to its subscribers in the one year almost as many pages as there are in the International dictionary. Perhaps our vocabulary is not so extended as Webster's, but we trust our subscribers will grant these 2,000 pages will give their full dollar's worth. Paper and a good many other things have been short, but with it all we trust our range of articles and the number of them and their quality will justify every subscriber in continuing, and more, passing on the word to neighbors Jones and Brown. The Cultivator is worth the money.

Next week will be given the index covering the past six months. Keep it and file every issue during the coming six months, when an equally interesting index will make permanent the value of the paper.

EFFICIENCY REDUCED

Secretary Meredith of the department of agriculture writes:

"The department of agriculture is receiving numerous inquiries from all parts of the country regarding the curtailment or discontinuance of various lines of work on account of reduced appropriations. These inquiries are coming from those interested in the activities affected and arise out of the action that is necessarily being taken by the department to bring its expenditures next year within the limits set by congress. In all these cases the department is urged to make some arrangement for the continuation of the particular lines of work involved.

"The agricultural appropriation bill for the fiscal year beginning July 1, 1920, recently passed by congress, carries approximately $6,000,000 less than the estimates made by the department as to its needs, and $2,185,000 less than the amount provided in the appropriation act for the current fiscal year. Although the effect of reduced funds on the work of the department was laid fully before congress while the bill was under consideration, this serious reduction has been made apparently on the ground of economy. I do not believe it is real economy, however, because it will certainly hamper the department in its efforts to aid the farmers of the country in doing their work of feeding and clothing the people, and will also handicap the department in administering some of the important regulatory laws entrusted to it for enforcement."

Too bad! The department work in many states will be abandoned entirely and in others greatly reduced. The bureau of markets suffered from last years' decrease and it will now suffer still more. Dairy investigations will be curtailed, work will be discontinued entirely in Texas-fever-tick free sections, the foot and mouth disease fund greatly reduced, cereal field stations will be closed, drug crop production work curtailed, food inspection reduced, forest experiment stations will be closed, crop estimate project discontinued, pink boll worm fund reduced, market news service curtailed, insect control stations abandoned.

But with it all we have one "blessing"—the congressional seed distribution will be continued. Of all the inconsistencies of congress this is the most glaring. It has appropriated $239,000 for this seed distribution. These pretty little packages of seeds will be sent out by all the congressmen to all voters who wish them, but economy demanded restriction of real constructive service. Gee!

AND FINALLY—THE BONUS

Another ex-service man writes regarding the bonus. He is from San Francisco and if we have his name right it is J. W. White Jr.

"As to the American Legion standing together as an organization, you are correct in your statement, but in my belief you will find a large percentage of them in case of another war will do as a great many did in the past war, i. e., look for the "soft" jobs on the farms.

"For one I am for the bonus strong. I served 27 months in France and on my return to the U. S. A. I found that the glad hand which was extended when I left had disappeared, and after my discharge I went to the company, with whom I was employed before entering service, only to find that the job I had before the war and the place promised me was there no longer and that I had better look elsewhere.

"I think if you will talk to a few ex-service men you will find that the above statement is the same in their case. So why fight against the bonus and the boys who gave up all they had to fight for the U. S. A.? If the newspapers and papers of your kind that are before the public at all times do not stay with us, what can you expect the next time? Do you think that the slackers and draft dodgers will come forward? They will not. It will be up to Uncle Sam to go get them, and the chances are he will not give the advance notice next time that he did this time."

This is the first time we have heard of the soft jobs on the farm during the great war. We all do know of guaranteed profits to capital, of high wages to shipbuilders and others more, we also know of willing self-denial, hard work and service on the part of millions of true hearted Americans that the boys at the front might be spared every hardship and as many of their lives be saved as possible.

To balance the advantages which were secured by many as a result of war conditions, it is possible that the only way is to be cold blooded and put it on an absolute commercial basis. We are sorry it is so. On this point our subscriber sends a statement by Henry G. Mathewson, associate editor, Californian Legion Magazine. From it we quote:

"After the war the government cancelled many billions of war contracts and settled on the average basis of 15 per cent of the expected profits—a huge bonus.

"The soldiers settled the war long before the country expected it, thereby saving thousands of lives and billions of dollars in war debt.

"The opportunities of war profits were not available when he returned and he was discharged without the necessary funds to help himself to a condition comparable to what he had left.

"The American Legion believes that the former soldier is entitled to have his choice of the fourfold plan of legislation. A large number will not select the cash bonus and are entitled to this selection, while the remainder that desire it may have the cash compensation."

THE NATIONAL TRACTOR AND IMPLEMENT SHOW OF THE WEST

The campaign to educate the American farmers as to the usefulness, the efficiency, the economy—the absolute necessity—of the tractor to American farming called for a campaign at the fairs, at special tractor and implement demonstrations, private demonstrations and tests, in fact thoroughly trying out this newest in farm power in every way. The demonstrations increased in number and hundreds of acres were plowed and tilled and retilled at each demonstration. There has gradually come a change and this year there will be held but two great demonstrations or shows in all America. To California has been extended the honor of one of these shows. It will be under the direct supervision of the Tractor and Implement Association of Southern California, which will be under the auspices of the National Implement and Vehicle Association. It will be held in Los Angeles or rather ten miles from the business center of Los Angeles in Verdugo Canyon, one and one-half miles north of Glendale. The other show will be held at Columbus, Ohio, in February, 1921.

Beauty will be combined with utility in the staging of this great event. The Verdugo Park is a bit of shady woodland with running water. Its 30 acres will be converted into fairy land and in addition there will be tractors, farm power appliances of practically every nature, implements, home light generators, modern home necessities and conveniences and all things mechanical pertaining to rural life. There will be a portion of the park made into a tent city where the visitor may secure accommodations and live amid ideal surroundings while taking in the great exhibit. There will be brass bands and other music. It is expected there will be entries from nearly every state in the Union.

New Ideas From Davis

By Jean A. Koethen

THE poultry school which has been held annually for four years past in some Southern California poultry center by members of the staff of the poultry division of the University of California has been something of an event in poultry circles. That it seemed less of an event this year is due, no doubt, partly to the fact that it was held two successive weeks at two different centers. The aggregate attendance was probably equal to that last year at San Gabriel, but the attendance at Van Nuys the first week in June and at Riverside the week before was disappointingly small. The fact that these two towns are at the extreme ends of the poultry producing area around Los Angeles was another contributing circumstance. San Gabriel and Gardena folks had a long way to go, whichever direction they took, and gasoline is dearer than last year and not too plentiful. Some of them were to be seen at Van Nuys every day, but the number was not large. Van Nuys poultry people turned out well and made the visitors welcome, and the hundred or more who were there found the high school auditorium a most comfortable place for listening, the lunches served by the students extremely appetizing, the school folks, both students and teachers, a cordial, courteous bunch, and the lectures and discussions well worth their while.

Stands for Trapnesting

Professor Dougherty has apparently changed his views on the respective merits of trapnesting and Hoganizing. Last year his approval of Hoganizing was quite emphatic. This year at Van Nuys he admitted that while selection by type, color and measurements works very well in grading a flock and picking out the drones, it does not guarantee that a hen will lay any given number of eggs in a year, or, indeed, that she will lay any at all. So far the trapnest is the only means we have of finding out just how many eggs a hen has laid, and if we are to breed from the best, we must trapnest.

It is not necessary, however, for everybody to trapnest. The distinction between commercial poultrymen and breeders is becoming more evident. The commercial poultryman who is able to buy his chicks from men who make a business of breeding for egg production cannot afford to trapnest, and if he is wise will not attempt it. The breeder who wants to sell chicks and hatching eggs at a good price will soon find that he must trapnest. And he is justified in charging a price for his stock that will make it worth while.

It is possible, Professor Dougherty says, for the poultryman who wants to select his best layers to do so by trapnesting his pullets part of the year. October, November and December are the months when the best layers are sure to be laying, and using the trapnest those three months will pick them out with almost mathematical certainty. In June, July and August, also, the best layers are laying, and fewer trapnests will be needed than are needed in the fall because the poorer layers have stopped and some of them have been culled out of the flock. While a nest to every three pullets is needed in the fall, one nest to five birds is sufficient in summer. The expense of labor, however, is so great, and the labor of watching trapnests so constant, that their use will not often be profitable to the commercial poultryman.

Culling the Flock

A great deal was said on Friday, both by Professor Dougherty and Professor Lloyd, about culling, and a demonstration in culling was given by the latter, which, like most demonstrations, demonstrated nothing to the satisfaction of the uninitiated. It is quite evident that if we must depend on color of shanks or thickness of pelvic bones, or distance apart of keel and pelvic bones, we are entirely at sea, for their value is only relative at the best. For instance, a hen was shown, which, if color is to be relied on, should have been a 200 egg layer. Shanks and beak and comb were pale, but it was plain from other marks that the paleness merely indicated lack of vigor, and the hen was quite past whatever usefulness she might once have possessed. Thickness of pelvic bones, Professor Lloyd admitted, is only relative, for the older the bird the thicker they are, whether she has been a high producer or not, and he was quite frank in saying that no one of these tests alone could be relied on. If they all coordinate—that is, if the hen with pale shanks, beak and vent has also a good comb, a warm, soft, full abdomen that will just fit into the palm of your hand, an alert eye, thin, flexible pelvic bones, and is of proper length from keel to pelvic bones, she may safely be kept in the flock.

Constitutional vigor, time of molting and time of beginning to produce are really, when all is said, the only reliable tests, outside of appearance of comb, which only tells whether or not a hen is actually laying and says nothing about her ability as a producer. The vigorous hen is the only one that can ever become what is called a "long distance" layer, that is, one that will lay profitably three or four years. The high producing type is the vigorous type, blocky in head, rectangular in body, long in back, deep in keel, with great digestive capacity, for the high producer must have a good digestion, whatever she may lack. This is imperative.

Alertness and quickness of motion are also characteristic of the high producer, for she must be a bird of highly sensitive nervous organization, or, as we commonly say, "high strung." Since egg production is also reproduction, it involves considerable nervous strain, and there must be a strong constitution underlying the nerves or the bird will break down under the strain.

Outside of the vigor test, the only culling tests that may be relied on are calendar tests. The best layers are the hens that begin earliest, provided they begin with a fair sized egg and lay longest before they molt. Hence banding the hens that begin in October and November and then banding those that are still laying the following October, will almost infallibly pick the high producers. A very successful poultryman several years ago told me these were his only tests of fitness, and there seems to be nothing more reliable.

A Case for the Doctor

Dr. Beach, pathologist of the Poultry Division and Assistant Farm Adviser Gordon, vaccinating a hen. (Dr. Beach in long coat).

For Smaller Flocks

It goes without saying that in any well ordered flock culling goes on all the time. Every hen that shows signs of ill health or weakness or that begins to molt before September should be immediately removed. Professor Dougherty declared himself emphatically in favor of smaller flocks and better ones. "Most of you," he insisted, "keep too many hens and too many individuals in a flock. Cull them down, keep fewer hens and better ones. You'll come to it in time, even if you can't see it now." He mentioned a man in the North who is making a good living and educating his children with 800 hens, and this man is only one of many.

Professor Lloyd was equally emphatic in condemning the common practice of raising a thousand or more chicks in a single flock, declaring that experiments at the farm had demonstrated the inadvisability of raising more than 300 chicks in one lot. The figures he gave, however, did not quite substantiate the statement, for his chart, giving certain student data for chicks in these comparatively small lots, put the mortality for the first ten days at 16 per cent, which seemed to the poultrymen present a big loss even for chicks brooded by the thousand. Some of these chicks were doubtless chicks that should never have been put in the brooder, but still the loss was large.

Breeding for Production

Breeding up a heavy laying strain is a matter of a generation, says Professor Dougherty. Don't expect to see much improvement in two or three years. In selecting eggs for hatching, see that they are of the color and size that extras should be—pure white, two ounces in weight, and with strong shells. They will all be from record hens, of course, but preferably not from those that make the highest record. A hen at the farm, now a profitable layer in her eighth year, and a 200 egg layer two seasons, has not laid a fertile egg in five years. As a breeder she is worthless. In order that you may know whose eggs are fertile and hatchable, mark the number of the hen on every egg she lays and at testing time credit each hen with the number of infertile and dead germs she has produced. You will find some heavy layers produce few infertile eggs and others whose eggs, though fertile, contain a germ too weak to hatch. Such hens are useful in the laying pen but of no value as breeders, and you will save time and money by keeping them where they belong. When you have found a hen that lays a good many eggs year after year, and eggs that are mostly hatchable, keep her as long as you can. There is no better breeder than a four year old hen. You do not need to test her for vigor. Her age is proof of that.

Some of the pullets from these eggs will lay more than their mothers, and some will lay fewer eggs. If the better ones are mated to a cock whose mother laid more eggs than the mother of the pullets there will be a little increase in production, and this procedure must be followed year after year till the 200 egg flock, which is now very rare indeed, is attained.

Fowl Cholera

The fact that fowl cholera, which has been supposed to be quite rare in California, has occurred in a good many flocks the past year was unwelcome news to all of us. Its appearance, according to Dr. Beach, was in so unusual a manner that it was not at first recognized. It began apparently with a broken egg in the abdomen of a pullet. An outstanding symptom was a twisted or wry neck, and there was usually a discharge of whitish material from the vent. Some of the affected birds died suddenly and some were ill for several weeks. Many ultimately recovered. In a large flock of ducks the disease appeared as a swelling in one leg. In another flock of hens its only indication was a pecu-

Agricultural News Notes of the Pacific Coast

Northern California

Nevada and El Dorado Counties report mild outbreak of pear blight.

The rice crop of Colusa County for 1920 is to be double the acreage of 1919.

Eureka, Humboldt County, is planning the manufacture of Swiss cheese on a large scale.

Prices have been named by the California Peach Growers and the California Fig Growers.

River boats on the rivers of Northern California report water very low and navigation difficult.

A forest fire in the mountains near Santa Rosa destroyed five square miles of valuable timber.

Lake County is concerned over the noncompletion of the state highway from Hopland to Lakeport.

Sonoma County farm bureau is boosting for a county fair which will be held in Santa Rosa, August 25-29.

Colusa County reports grain short as a result of insufficient rain, but high prices also reign and returns are good.

The rice acreage is much smaller than last year, but the fields already planted indicate a condition above average.

The Glenn County Hog Growers Association has been formed and will aim to market all the hogs in the county.

Expert sheep shearers at Dixon, Solano County, have made as high as $31.50 a day. One man sheared 150 in one day.

Sonoma County fair will open on August 23 instead of August 25, as previously arranged, and will continue to August 29.

The Poultry Producers of Central California, Inc., reports on hand in storage and in transit eggs to the value of $565,384.

The new peach sizing device patented by the United States bureau of markets will be in general use through the state this season.

Petaluma recently reports one day's shipment of eggs: "Three cars 1,436 cases, Petaluma to New York; one car 480 cases, Petaluma to New Jersey."

The Booneville center of the Mendocino County farm bureau has indorsed the wool pool which is sponsored by the state farm bureau federation.

Irrigators of the northern part of the Sacramento Valley are organizing to fight proposal of the delta farmers to divert water from the Sacramento and its tributaries.

Dates have not been definitely set for the farm products show to be held at Hayward, Alameda County, but it will probably be pulled off during the second week in August.

San Francisco announces the probable erection of a three million dollar assembling plant for the purpose of collecting and distributing the products and manufactures of Japan.

Petitions are now in circulation for an initiative amendment to the present state anti-alien land law. According to Senator Inman this law will stop buying and leasing of lands by aliens ineligible to citizenship and prohibit corporations, the majority of whose members are aliens, from acquiring land.

Central California

Fresno reports the first rainless May for 30 years.

California has 420,000 registered motor vehicles.

Turlock is planning for big exhibit at the state fair.

Tulare's recent fat hog sale secured top price of $15.75.

There are 18,000,000 acres of national forests in California.

San Jose reports prune contracts being made on a 12 cent basis.

Some contracts are closed for fresh wine grapes. As high as $60 per ton.

Stanislaus Farmers Union plans installation of cooperative store at Modesto.

Turlock cannery announces that it will operate notwithstanding the sugar shortage.

Tulare County is maintaining an exhibit in the Exposition Building in Los Angeles.

The farm bureau of Madera County is investigating prospects of securing a cannery at Madera.

Board of trade of Ceres, Stanislaus County, is planning for satisfactory housing of fruit workers.

Prices being offered for fresh peaches indicate that they will sell even higher than last year.

Santa Cruz farm bureau meetings: Directors, June 18; Aptos, 18; Santa Cruz, 24; Happy Valley, 25.

June crop will be discussed at the citrus institute to be held at Porterville, Tulare County, June 25-26.

The California State Automobile Association has requested motorists to cut down use of gasoline for pleasure riding 50 per cent.

The California Peach Growers, Inc., is making an active campaign to secure contracts with 6,500 peach growers on a four year basis.

A dehydrating plant is to be constructed at Brack Station, near Lodi. It will have a capacity of eight tons of grapes every 24 hours.

Present cantaloupe plantings in the Turlock section are estimated at 4,864 acres, and it is thought that the crop will run to about 3,000 carloads.

The California Peach Growers, Inc., which is now also the fig growers association, is endeavoring to secure 75 per cent of the fig acreage of the state.

Charges by fruit growers of the Santa Clara Valley that the canners are combining to force down the price of fruit are emphatically denied by the canners.

The Stanislaus County farm bureau will hold local meetings at Denair, June 14; Turlock, 15; Mitchell, 15; Hickman-Waterford, 16; Fairview, 18; Laurel Lodge, 21; Claus, 23; Ceres, 24; Orange Blossom, 28.

The biggest fresh fruit shipment of any year in the California industry is expected, providing cars for transportation can be had. Some observers think it will reach at least 36,000 cars as against 29,636 last year.

The California Associated Raisin Company is distributing $4,500,000 to growers. This figure represents a total of 9 cents for Muscats, Malagas and Feherzagos and 10½ cents for Sultanas and Thompsons. The final payment will not be made until November.

Southern California

Much late corn for filling silos is being planted in Orange County.

Beaumont, Riverside County, celebrated a "cherry day" on June 12.

Palo Verde reports warm weather bringing up the cotton in fine shape.

Lankershim, Los Angeles County, held a big community picnic, May 31.

Coachella Valley's 1920 onion crop, now harvested, amounted to 1,800 cars.

Grain thrips are attacking cherry and apple trees in San Bernardino County.

Tomatoes were shipped from Imperial County in May to the amount of 279,577 crates.

Apricot growers of Ventura County last week inspected their new packing house at Santa Paula.

Growers of wine grapes at Cucamonga and Etiwanda report offers of $50 per ton on the vines.

The Villa Park Orchard Association has begun construction of a new sweathouse to color Valencias.

The San Dimas Lemon Association did a business last year amounting to over a half million dollars.

Ranchers around San Bernardino report water in wells is two feet higher than at same date last year.

The California Growers Association at Hemet is calling for women workers to start on the apricot pack, June 25.

Fourteen Japanese were arrested last week in Los Angeles County charged with giving short weight in berry boxes.

The first solid express train of cantaloupes left Imperial Valley, Saturday night, May 29. It was made up of 25 carloads.

Ranchers in the San Bernardino Valley, under the direction of the farm bureau, have organized a potato growers association.

Grasshoppers are doing much damage to cattle ranges in the higher districts of San Diego, San Bernardino and Riverside Counties.

A sawmill has just started operating in Holcomb Valley, San Bernardino County, and will cut at least a half million feet this summer.

Ventura County has been divided into 18 districts by directors of the fair association and arrangements of exhibits will be made on a district basis.

Jews in California are seeking 30,000 date palm leaves for religious services during the "Passover" and have applied to the Coachella Valley for the supply.

The Ontario plant of the California Growers Association will open for the apricot season about the end of June. The cannery is now being thoroughly overhauled.

Proposal to allow a lower standard on apricots in lug boxes was ruled undesirable by Director of Agriculture Hecke, and apricots in lugs will be held at the same standard as apricots in crates.

C. L. Emerson has presented the city of Riverside with five acres in the mountains near San Jacinto, to be used as a municipal playground, and Uncle Sam is to be asked for 80 acres adjoining.

The Coast and General

A heavy crop of oranges is in prospect for Florida.

Georgia's peach crop is moving into Eastern markets.

The wheat acreage in Arizona for this year is the largest ever sown.

Several of the Florida citrus exchanges are building pre-coolers.

Generally favorable conditions are reported on Arizona stock ranges.

The 1920 cotton crop of Arizona is now reported 80 per cent of normal.

Late frosts have somewhat damaged berries in southwestern Washington.

The fish catch of the Dominion of Canada for 1919 was valued at $35,000,000.

Whatcom County, Washington, reports its egg business amounts annually to over $1,000,000.

Petersburg, Alaska, reports six new islands lately taken up by settlers and stocked with blue foxes.

The evaporation of sweet corn has developed into an important industry at Lancaster, Pennsylvania.

A bill for standardizing onion grades is proposed by the department of agriculture of British Columbia.

Winter wheat in western Oregon is heading short but in remainder of state a normal crop is reported.

The Walla Walla Valley of Washington expects to ship 1,000 cars of onions during July and August.

Estimates as to potato production of British Columbia this year indicate a crop of about 2,750,000 bushels.

Fruit growers in the district about Walla Walla, Washington, have organized a cooperative marketing association.

Berry growers of Washington anticipate good markets on account of the demand for their product for making soft drinks.

New varieties of wheat, oats, barley and rice have been developed in Alaska that will mature within 100 days from seeding.

The farm bureau of Cochise County, Arizona, has bought, for members, 10 carloads of dairy cattle during May and still is buying.

Apples in the lower part of the Yakima Valley, Washington, were damaged by frost from 25 to 75 per cent according to Inspector Robinson.

Owners of native walnut trees in Arizona have started such a movement for top grafting to English walnut that the graft stock is exhausted.

Apple growers and shippers at Hood River, Oregon, are revising their estimates of the 1920 apple crop. It is now thought it will not be over 1,000,000 boxes.

Shorthorn breeders of Linn County, Oregon, are planning a "Shorthorn Shoutfest," along the lines of the recent Jersey Jubilee, in a tour of the Shorthorn herds of Linn County.

At the recent annual meeting of the Okanogan United Growers it was announced that the fruit growers forming the membership had transacted business amounting to over $2,000,000.

Texas sweet potato growers last fall sent thousands of bushels of potatoes to curing plants, unaware that they had been frost injured, and the result has been somewhat disastrous to both growers and handlers.

An Evaporator for Community Use

By W. V. Cruess

DRYING offers a simple, convenient and economical method of preserving fruit and vegetables. Where there is a considerable quantity of produce from the gardens and back yard fruit trees in a given community the surplus may in many cases be very satisfactorily taken care of in a small cooperatively owned and operated evaporator.

If such a drier is built solely for the purpose of saving the surplus fruits and vegetables of the neighborhood, the venture has every chance of success; if undertaken with the expectation that remarkable and unusual profits are to be realized from sale of the dried products, disappointment will be the usual result.

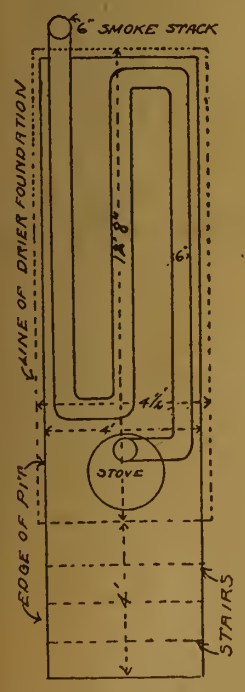
There is, nevertheless, a legitimate place for such driers and many communities could install them to advantage. In localities of abundant sunshine fruits may be dried in the sun but sun dried vegetables are not very satisfactory.

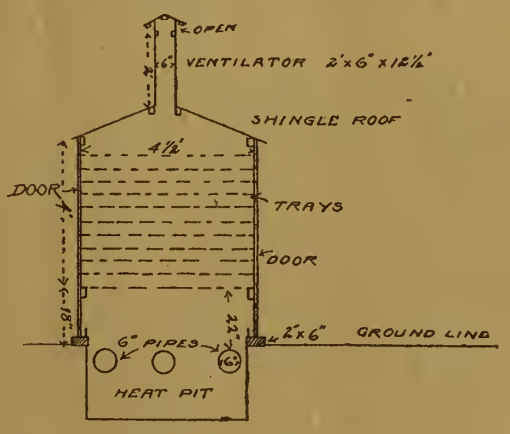
The exaporator to be described in this article may be constructed of materials easily obtained in most localities. It is a modification of the Topping evaporator, which has been in use for many years in eastern states and for this reason no patent rights are violated in its construction or use.

The drier is designed for use in the open. It consists first of an air heating pit which holds a stove and system of pipes. Above the fire pit rests a box like chamber of four (or less) compartments in which the trays containing the fruit or vegetables are placed. The evaporator may be said to be of a simple "stack type" and resembles the stack evaporator used for apple drying throughout California.

The Fire Pit

A pit three and one-half feet wide and twelve feet long is first constructed. This contains at one end an excavation four feet deep and six feet long for the stove, with steps leading to this excavation as shown in the sketches. The remaining six feet of the fire pit need be only two feet deep as it contains the heating pipes only.





PLAN OF HEATING SYSTEM CROSS SECTION

Figure No. 1—Plan and Cross Section of Heating System.
Drawn by Professor W. V. Cruess

The Air Heating System

A sheet metal stove about two feet in diameter by about 30 inches high will answer the purpose, such, for example, as an ordinary large size "air tight heater." An empty 50 gallon distillate drum may be fitted to receive at one end a six inch stove pipe and an opening large enough to permit firing made in the side of the drum near the opposite end. This style of stove is used in a number of driers in Fresno County. But if this style of heater is used it will be wise to increase the depth of the stove pit to about five feet to reduce the fire risk.

An elbow six inches in diameter is attached to the stove outlet; to this a piece of six inch pipe about one foot long and at right angles to greater diameter of pit is attached; to this a second elbow; to the second elbow a piece of six inch stove pipe about eight and a half feet long, which extends horizontally to the opposite end of the pit where it connects to a double elbow, that is, two elbows joined together, or to a return bind; to this is attached a second piece of pipe about eight feet long leading back to furnace end of pit; to this in turn an elbow and third piece of pipe which returns to smoke stack end of pit and connects to the smoke stack as shown in accompanying figures. The smoke stack should be about 15 feet high and fitted with damper. A kerosene or stove burner capable of burning about two gallons of kerosene per hour is shown in the sketch. Because of scarcity of petroleum fuels it may be necessary to burn wood or coal. It is advised that the possibility of obtaining kerosene or stove oil be investigated before the drier is built.

The Drying Cabinet

The drying chamber is 12½ feet long by 4½ feet wide. It is built upon a frame of two by four resting upon a base of two by eight material. The walls are 64 inches in height between this base and the eaves. The peak of the roof is 18 inches above eaves and joins an open ventilator six inches wide by two feet high and extending the entire length of the drier, as shown in Figures 1 and 3. The drying chamber is divided into four compartments by two by four studding placed 38½ inches on center making each compartment 36½ inches wide. Beginning at a distance of 16 inches above the base support, one by two strips edgewise and four and a half feet long are nailed to these uprights for support of trays. This places the lowest tray about 22 inches above the heating pipes or stove. The tray supports are placed four inches apart on center, giving a total of 11 supports for each compartment or 44 for the entire evaporator. The compartments connect with each other at the sides, the tray supports being the only impediment to free circulation of air between compartments. The ends of the drier are closed by four inch T and G over a two by four frame or by battened rough one inch material. Roof is shingled over two by four rafters and one by six sheathing. The ventilator may be made of T and G or of one inch material battened. The frame of the drier should be about four inches off the ground in order to admit air freely as indicated in Figure 3. Each side of the drier is made up of four doors as shown in the sketches, permitting trays to be placed in the drier from both sides and affords easy inspection of all trays in the drier. Each tray support accommodates two two by three foot trays; the entire drier holds 88 such trays. The drier may be made smaller by decreasing the length, width and height, and increased by increasing the length. Increase of height is inadvisable because such increase seriously retards rate of drying.

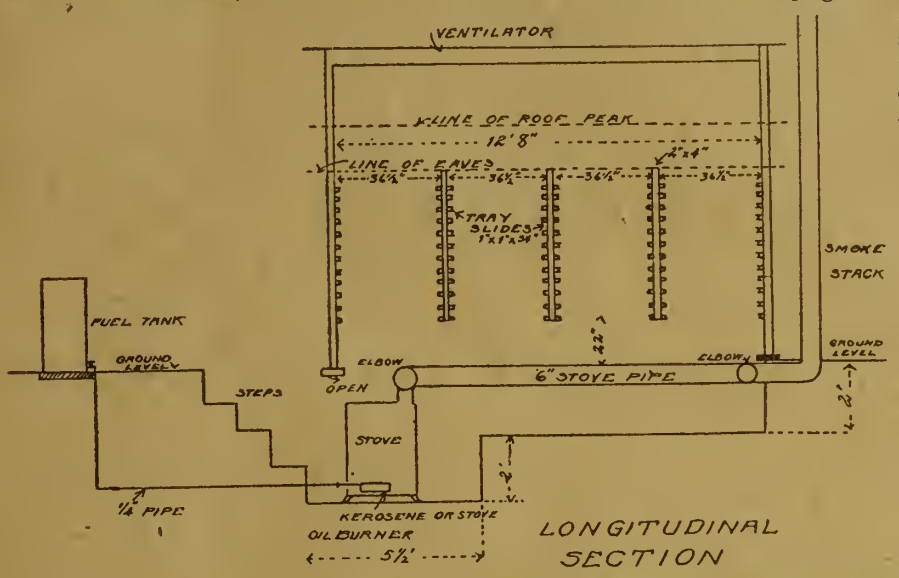


Figure No. 2, Longitudinal Section of Dryer and Plan of Trays
Drawing by Cruess showing tray slides, location of fuel tanks, stoves, pipe ventilator, etc.

Capacity

Each square foot of tray surface will hold about two to three pounds of apricots, peaches and prunes, about one and one-half pounds of sliced vegetables and about three pounds of grapes. Or the drier will hold about 675 pounds of vegetables, about 875 pounds of most fruits, and about 1200 pounds of grapes.

The Trays

The frame of the trays consists of the following parts: Each side: One piece 36x1½x1 inches; one piece 33x 1½x1 inches.

Each end: One piece 24x1½x1 inches; one piece 21x1½x1 inches.

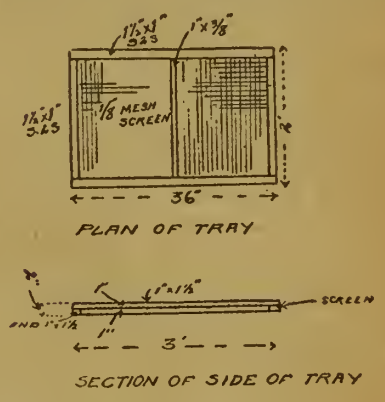
Center supports: Two pieces 21x1 x⅜ inches.

A piece of screen one-eighth of an inch mesh or ordinary door screen and two by three feet in size is placed between the pieces making up the sides and ends of the tray. The center supports are nailed to sides of tray.

The trays are one-half inch shorter than the width of each compartment, thus permitting the trays to slide easily along the tray supports. If fruit is to be sulfured on the trays the screen should first be coated with a thin layer of hot paraffin to reduce corrosion of the metal.

Thermometers

At least four ordinary dairy thermometers reading to 212 degrees Fahrenheit should be available. One of these is placed on the lowest tray of each compartment in order that the fire may be regulated to give the desired temperature. Do not attempt to operate the drier without thermometers.



Asbestos Lining

The framework and walls for a few inches above the base board should be covered with sheet asbestos or sheet metal to reduce the fire risk. The entire evaporator may be built of sheet metal and thus rendered fireproof; or the walls may be built of brick or cement up to a height of 18 inches from the ground level.

Operation

In using the drier the trays are loaded with the prepared material. Preparation consists in the cases of peaches and apricots of pitting, spreading one layer deep on trays with cups upward and exposing to fumes of burning sulfur in a closed box for three hours. Pears are cut in quarters and sulfured as above. Halved pears dry too slowly. Prunes are dipped about 20 seconds in a boiling lye solution of one-half ounce soda lye per gallon and are not sulfured. Thompson seedless grapes, Tokays and Cornichon grapes are dipped for about five seconds in boiling lye of the strength used for prunes but are rinsed in water after dipping. Muscat grapes and other varieties require a dip in a boiling lye solution of three ounces of soda lye per gallon for about 30 seconds followed by rinsing. In all cases dip long enough to crack the skin. Apples are peeled, sliced and sulfured 30 minutes. String beans, peas and corn are prepared as for

More and Better Alfalfa
Can Be Produced By Using

If you are producing crops that require sulphur, such as alfalfa, beans, potatoes, cotton, barley, melilotus, milo and fruits, you are interested in recent important experiments showing that these crops require and take from the soil, large amounts of sulphur.

In Bulletin No. 163, of the Oregon Experiment Station, it is reported that "the amount of sulphur in alfalfa hay from fertilized, vigorous plants varied from 3.34 to 4.54 pounds per ton." The report says further, "Experiments conducted in 1915 to 1919 inclusive, on various types of soils showed that the alfalfa and clover crops can be increased from 50 to 1,000 per cent on many soils by use of various fertilizers containing sulphur."

Sulphur is most available as plant food in AGRI GYPSUM, and it is in the form of a sulphate—ready to be taken into the plant life. Think what it would mean to you with alfalfa selling at from $28.00 to $35.00 per ton to DOUBLE the yield with the use of $4.00 or $5.00 worth of AGRI GYPSUM to the acre. Many have had better results.

AGRI GYPSUM contains the plant food your alfalfa needs. In most soils sulphates are lacking, due to the continued taking of sulphur from the soil and the washing away by rains and irrigation. Put this back in the soil at small expense by applying AGRI GYPSUM.

In addition to securing a bigger crop you may very reasonably expect to grow BETTER alfalfa with more leaves and higher feeding value, which will bring better prices.

AGRI GYPSUM combines with other elements in the soil, making them more readily available as plant food. It sets free the nitrogen, calcium, sulphur and other crop growing elements.

USE AGRI GYPSUM ON ALKALI SOILS. It is a matter of official record that alkali soils may be reclaimed and made to produce splendid crops by the use of AGRI GYPSUM. Try some on any alkali spot in your bean field, or on any alkali ground, noting the beneficial results.

AGRI GYPSUM IS MADE BY THE LARGEST PRODUCERS OF GYPSUM IN THE WORLD. Ask your dealers for AGRI GYPSUM and you will be sure of the right product, ground fine, to do the most good. The cost is low and good results sure. If your dealer cannot supply you, write

United States Gypsum Company
(Sole Producers of AGRI GYPSUM)
902 Citizens National Bank Bldg. Los Angeles, Cal.

Place Your Order NOW for Nitrate of Lime

Guaranteed not less than 13 per cent Nitrogen—almost 100 per cent Pure.

Nitrate of Lime supplies Nitrogen in the most available form. Packed in solid wooden casks about 240 pounds.

Ask for prices, delivery from warehouse, Los Angeles and San Francisco, or ex steamer to arrive.
C. HENRY SMITH, General Agent
Pacific Coast and Hawaiian Islands
311 California St., San Francisco.

BEES PAY

Bee-keepers can obtain from the Apiary Department of the Diamond Match Co. the finest quality of Bee-Keepers' Supplies at fair prices.

The Apiary Department, which is in charge of experienced Bee-Keepers, is one of the largest of its kind in the United States and maintains a constant excellence of produce and unsurpassed service.

Write for catalogue and if a beginner for Cottage Bee-Keeping, which will be promptly mailed free.

THE DIAMOND MATCH CO.
APIARY DEPARTMENT
CHICO, CALIFORNIA, U. S. A.

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

cooking and then dipped in boiling water five minutes and chilled in cold water. Potatoes are peeled, sliced and dipped in boiling water about one minute, until heated through. Greens are usually dried untreated after thorough rinsing to remove sand, etc. Spread

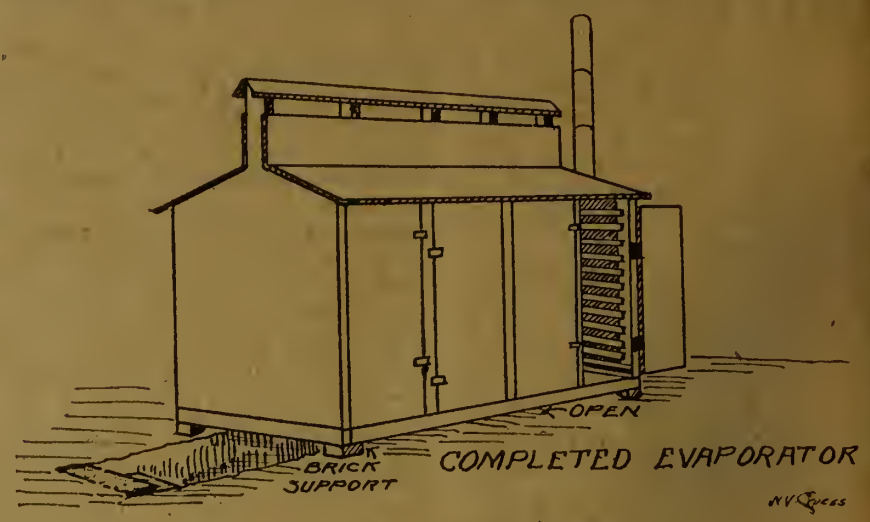


Figure No. 3, As It Looks Completed
Simple, not expensive and effective.

vegetables in thin layers to obtain drying.

Start the fire and regulate fire and damper so that lower trays above the furnace end of drier are maintained about 165 degrees to 170 degrees Fahrenheit, not higher. The trays in other compartments will be at temperatures somewhat lower than this because heat is most intense at furnace end; if difference is too great place a piece of sheet metal above the stove. If the trays are "staggered" on the runways, that is, if trays on lower runway extend to one wall of drier, the trays on shelf above to opposite wall leaving a six inch space at one side; the third tier of trays placed against opposite side and so on for succeeding trays the air will tend to be more evenly distributed.

As soon as lower tray is dry remove it and shift the whole stack of trays down one tray. Insert a fresh tray at the top. Thus each tray enters at the cool part of the drier and finishes at the hot part, utilizing the heat efficiently. Vegetables should be dried "bone dry"; fruit to a leathery degree of dryness. Apples should dry in about six hours; prunes in about 24 hours; apricots and peaches in about 15 hours; vegetables in six to ten hours; and grapes in 24 hours.

Insect Proof Containers

Pack all dried produce at once into sealed jars, cans or insect proof boxes. Keeping insects from the dried product is an absolute necessity; neglect of this precaution has spoiled millions of dollars worth of dried products and is the most important problem confronting the commercial producers of dried vegetables.

If wood is used instead of kerosene or stove oil as fuel the cost will be reduced considerably. If sheet metal is used for construction or a cement or brick foundation used, the cost will be greater than given above. In many cases the fruit grower can build the entire drier by his own labor and cut the cost estimates given above.

General Suggestions

Building and operating a drier involves a great deal of time, thought and attention spent in various ways even under the best of conditions and regardless of the size of the outfit used. Considerable ingenuity and resourcefulness and above all a "sweet temper" are needed to make a drier a success. If these facts are realized before the work is undertaken success will follow.

In operating a community owned plant the delivery of fruits and vegetables should be so planned that one variety is handled each day and so that not too much material for the capacity of the drier is delivered at any one time. It will be necessary to enlist the aid of some public spirited person who is familiar with the operations involved if delay is to be avoided.

Save the Fruits

This article by Prof. Cruess should help in attracting attention to the possibility of preparation for unfortunate weather conditions or for handling a large quantity of fruits and vegetables which would be waste, and make of them a valuable product.

Unfortunately there has been no general agreement on methods or even name of the processes of drying. Some prefer "California Dried;" some, "Evaporated;" others, "Dehydrated." Many maintain especially that there is a material difference between the processes of dehydration and evaporation.

Certain it is there are effective methods. There are manufactured ready-to-use dehydrators and evaporators which may be installed under direction of competent engineer without necessity for growers familiarizing themselves with the process other than to practically manipulate it after erection. Several of these installed dehydrators and evaporators have proven entirely satisfactory and their installation is extending almost every day.

A Possible Source of Cheap Nitrogen

By Fred M. Reed

THOSE of us who have been in the citrus game in Southern California for 30 years or more have seen the fertilizer question change from a matter of getting rid of men trying to sell all kinds of fertilizer for any old price, to getting sufficient supplies of any kind without much regard to price. We used to get sheep manure for two cents delivered in the grove; now we pay ten cents or more for it on the car, and every sheep corral in California, Utah, Nevada and Arizona within hauling distance of a railroad is being scraped for shipment direct to the citrus groves or to be used as "filler" for much higher priced commercial goods. We use all the alfalfa we can get, all the bean straw, steer manure from the Imperial Valley and the city stock yards, nitrate of soda from Chile, sulphate of ammonia from the Eastern factories, fish scrap from the whole Pacific Coast, and all the local manures available, and yet there is no prospect of the supply ever being better nor of the price getting lower Nor will it be practicable to divert any part of the available supply of irrigating water from the growing of food crops to the culture of alfalfa or other legumes to be used as raw fertilizers, because the available supplies of water in Southern California are now developed and in use, and future increase of the supply by new development will be at ever increasing cost.

The observations of the writer as an amateur botanist have led him to believe that there is still a great source of supplies of organic nitrogen bearing fertilizers still untapped and possible of practical development without encroaching on the supply of irrigating water or of the better food producing lands. I refer to the many native leguminous plants, now mostly unknown and unnoticed except by bot

unists, which even in their wild state should produce considerable quantities of herbage that should be as valuable as alfalfa or bean straw for fertilizer.

There is no reason why the seeds of these plants should not be collected and subjected to cultivation and modern methods of improvement by seed selection. These plants could be grown on the cheapest and poorest lands without expensive cultivation and without irrigation, and the great cooperative organizations could easily have these crops grown by contract for their members under the same system of supervision by experts that they employ in selecting buds and furnishing other supplies.

For example, there are several species of clover, such as Trifolium neolagopus and Trifolium columbium, that grow remarkably well on high and dry mesas, that ought to prove a thoroughly satisfactory fertilizer. These clovers ought to be a bonanza to the dry land farmers as a cash crop to grow alternately with grain. Then there is every reason to believe that a strain of lupine, of the type of Lupinus micranthus and its varieties, could be developed that would produce a good crop on the poorest and dryest soils. The Hosackia family is still more promising, the best of them being the "Spanish clover," Hosackia purshiana. This plant grows thick and a foot or more high on ground too hard and dry to plow, and should respond readily to cultivation and improvement. The perennial "deer weed," Hosackia glabra, would produce a heavy crop on land that would be too rough and poor for most ordinary crops, and in addition would afford an immense amount of bee pasture. Hosackia strigosa shows great possibilities in this line, and down on the Colorado desert there is a perennial species, Hosackia rigida, that grows vigorously, producing great quantities of seeds on individual plots, on hillsides so sterile and rocky that it is a wonder that any plant can endure.

These are only a few out of a considerable list of native plants capable of being improved and domesticated, that can easily be made to produce an abundant and comparatively cheap supply of organic fertilizer, rich in nitrogen, and that could be produced without encroaching upon the available supply of irrigating water or lands now producing food crops.

Pineapples in California

By Ernest Braunton

PINEAPPLES are native to America; not to the United States, but to tropical America in general. They will grow and thrive, so far as temperature is a limitation, where light frosts prevail. This statement would, unqualified, appeal to Californians. Our climate is not too hot for them, but too dry. A soil retentive of moisture, but well drained, with a light shade to prevent the sun pulling it out of the soil, is the combination needed. The plants need shade in summer and will fruit in winter without protection in practically frostless places.

In California we depend mainly upon Hawaii for our pineapples and Eastern states have looked to Florida and the West Indies for their supply, principally to Cuba and Porto Rico. But of late the Floridan crop is each year less of a factor, for the incurable wilt is fast retiring the pineapple from commercial plantations in that state. Down there they will tell you that the plants will not thrive in a moist atmosphere, but during the summer season in California they are benefited by more humidity than nature provides.

Out at Hollywood, near Los Angeles, H. Zulauf has a dozen plants on the south side of a tight board fence, that have produced fruits second to none. Those who have eaten them told the writer they were the very best they have found. These were planted from tips cut off above Hawaiian pineapples bought in the local market and therefore varietal names are unknown. The fruits weigh about three pounds each and ripen in early spring. It is quite evident that the plants should be grown in summer for fruits in winter. As the plants rapidly develop top shoots it is but a short time until one may have a good family stock of plants.

In 1893-4 the writer grew several hundred plants, in four named varieties, stock obtained from Florida. From experience gained thereby, joined with subsequent observations, it is evident that soil should be well drained at all seasons, though it may be sandy, heavy or a medium loam. Our winter climate is favorable, and the hottest place should be chosen, such as the south side of a fence, hedge or building. If there is danger of frosts the plants should be covered at night, but never during the days of winter. About May the plants should be covered with lath frames or, better still, with the lightest cheesecloth to be had. When the hot weather is past take shade away, for heat is needed. If the location is on a slope so water escapes easily, the soil may be very shallow. It is said that on the Florida Keys the plants fruit perfectly on but one or two inches of leaf mold overlying a coralline rock.

THE NITRATE INDUSTRY OF CHILE

Chile is the only country in the world known to contain commercially important deposits of nitrate of soda, a product which has a wide variety of uses, but is best known as a valuable fertilizer. Two grades of nitrate are produced—95 per cent, or ordinary nitrate, which is used for fertilizer purposes, and 96 per cent, or refined nitrate, which is used for manufacturing purposes.

Before the war, approximately 75 per cent of the nitrate marketed was of the lower grade. Private business in Chile and government revenue are both dependent on the prosperity of the nitrate industry, since this one product ordinarily constitutes nearly 80 per cent of the country's exports, and the export tax on nitrate and its principal by-product, iodine, constitutes more than half the government's total income.

The nitrate fields, the principal source of Chile's wealth, are limited to a narrow strip of arid desert located on the eastern slope of the coastal range, west of the Cordillera of the Andes, at an altitude of from 2,000 to 5,000 feet above sea level, and inland a distance varying from 16 miles in the northern part of the zone to 90 miles in the southern part.

CALIFORNIA SOIL BORINGS

Dr. C. B. Lipman of the state college of agriculture reports that from studies of auger borings at various depths down to seven feet in a number of different soils, it was found that previous findings to the effect that microorganisms of arid soils penetrate deeply into the subsoil layers, were confirmed.

It was demonstrated that ammonification continues undiminished through six feet of soil in every case. While this was not true for the nitrifying powers of the same soils, it is considered clear that nitrifying bacteria do live in the lower layers of some, and perhaps all, of the soils to similar depths. The great difference between the two is attributed to the fact that the nitrifying power of these soils diminishes rapidly downward from the first foot, while the ammonifying power remains apparently unchanged. The nitrogen fixation results were for the most part inconclusive, but seemed in general to confirm the idea that bacteria and other microorganisms do penetrate to greater depths in arid soils than would be generally expected. Such penetration and activity at those depths seem to be superior to those noted on humid soils.

The San Francisco Chronicle quotes "a large rice grower" as saying: "The acreage planted to rice this year will be equal to last year's, this being made possible in spite of the drouth because of centralized control of water and prevention of waste."

Plant Teague Trees

They Are Grown From Selected Buds Taken From Trees With Individual Performance Records both for Quality and Quantity Production

LEMONS

We can supply Eurekas, Villa Francas, and Lisbons. All budded from the best and most prolific bearing types. If you have lemon land do not be afraid to plant Lemons. They will yield satisfactory returns when they come into bearing.

LIMES

Every home orchard in the protected localities should contain one or more lime trees. We have some extra large trees of both the Mexican and Tahiti Seedless varieties.

POMELOS

We still have a few nice Marsh Seedless, Triumph, Imperial, Foster and Duncan trees unsold.

Handsome returns are realized from Pomelo orchards where properly planted and cared for.

ORANGES

We can still supply a limited quantity of Navels, Valencia Lates, Mediterranean Sweets, Ruby Bloods, St. Michaels, Tangerines and Mandarins for both home and orchard planting.

AVOCADOS

Good thrifty field grown Fuerte and Sharpless trees for immediate delivery.

FEIJOAS

Grafted from the best large fruiting varieties.

Write for our new descriptive price list describing forty-six varieties of Oranges, Lemons, Limes and Pomelos and seventeen varieties of Avocados and other Tropical fruits.

It's free to those interested.

Cheap pumping- use the wind

FARMERS all over the country have proven that the ECLIPSE WOOD WINDMILL insures a reliable water supply at the lowest possible cost.

Some ECLIPSE WINDMILLS erected 38 years ago are still pumping—with no repair bills. On this basis, the cost of your water supply is about $1.65 a year if you use the ECLIPSE.

Efficient—will pump water with only a light breeze blowing. Requires only occasional oiling — has direct stroke — no gears — but little friction—noiseless.

Have your dealer tell you about the superior construction of the ECLIPSE, its long life and other features.

$1.65 a year

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.
Maintain a moist surface mulch.
Will prevent June drop.
Require less irrigation than other crops.
Need no irrigation where soil moisture has been conserved.
Build up poor soils with more nitrogen bacteria and humus than any other covercrop.
Afford the best kind of pasture for cattle and hogs.
As a hay have a food value of 43% more than Alfalfa.
Will improve your silage.
There is no better Bee Pasture.
Thirty pounds of seed is sufficient to plant one acre.
Our seed germinated 96%.

Nurserymens Bud Selection Association

THE annual meeting of the stockholders of the Nurserymen's Bud Selection Association of California was held at the Plaza Hotel, San Francisco, on June 5. The following directors were elected for the ensuing year: William T. Kirkman Jr., Fresno; J. E. Bergtholdt, Newcastle; J. S. Armstrong, Ontario; J. W. Barnicott, Newcastle; H. A. Hydc, Watsonville; Max Crow, Gilroy; Almon Wheeler, San Jose.

General Manager L. B. Scott presented a detailed report outlining the work which had been done up to date and forecasting the work of the association during the next year. He stated in his report that the work of the investigational staff of the association was well under way. This includes the securing of performance records in individual orchards of the different fruit varieties which have been recommended by the canners, shippers and growers in the different meetings which have been held in San Francisco, San Jose and Sacramento.

The association will not furnish the buds which will be used by the different nursery members this coming year, but will furnish each nursery which is a member of the association with a list of the orchards in which the investigational staff is working, so that the members who belong to the association can use this information in selecting their bud wood.

The individual tree performance records which havc been started this year in orchards of the different fruit varieties will be continued in 1921 and in succeeding years. All the buds used by the different members of the association in 1921 and in succeeding years will be sold at cost to the different members and will actually be cut by representatives of the association. The first two seasons' records will have been secured by 1921 and association representatives will be able to make a selection of bud wood from record trees.

A central bud farm will be secured, and buds will be selected in 1921 from record trees for propagation at this farm. Eventually the second generation trees on this farm will yield a large amount of bud wood which will be sold to the different nursery members who belong to the association and to any fruit grower who desires to purchase buds or scions for top working.

The association has placed at the disposal of the United States department of agriculture the sum of $5,000, which will be expended during the summer months in detailed investigationai studies. These studies will be in addition to the investigational work which is carried on by the members of the Nurserymen's Bud Selction Association staff and will include the studies of fruit and leaf characteristics and habit of growth of individual trees in small blocks in each of the important deciduous fruit varieties. This work wiii be carried on in just the same careful, painstaking way as the citrus fruit investigational work has been conducted, and will be under the direct charge of Mr. A. D. Shamel of the United States department of agriculture, who will be assisted in his investigations by R E. Caryl and other department representatives. The commercial performance record work which will be conducted by the association itself will be handled by Mr. Scott, V. W. Hoffman and Millard Sharpe.

Recognizing the fact that there are a number of nurseries in the state which would like to receive the benefits of the work of the association, the stockholders voted to reduce the minimum amount of capltal stock which must be owned by any nursery from $1,000 to $300. As only ten per cent of this amount is payable on joining the association, it is within the reach of every nursery in the state to obtain the benefits of the association. The capital stock of the association will be used only in the purchase or lease of land for a central bud farm and for other permanent equipment. The running cxpcnses of the organization during the year 1920 will be met by an assessment at the rate of $5 per thousand on all buds put in by the different firms which belong to the association. In 1921 and in succeeding years the cxpenses of the organizatlon will be met by thc actual selling price of buds furnished to al members. Any nursery, however whlch does not joln the associatio until 1921 will have to pay an entranc assessment equivalent to the numbe of buds handled by that nursery i 1920 at the rate of $5 per thousand in addition to the selling price of the buds in 1921. This stipulation is made in the hope that all the legitimate nurseries in the state will avail themselvcs of the work of the association and unite with the association during the present year.

The following are the officers fo the ensuing year: President, William T. Kirkman Jr., Fresno; vice-presi dent, J. E. Bergtholdt, Newcastle; sec retary-treasurer, Max Crow, Gilroy.

JUNE DROP TO BE DISCUSSED

Tulare County has called a plant pathological congress to be held June 25 and 26.

Every effort is being made to have the meeting develop on the practical side of fruit production, and technical and scientific talks will be avoided. The day and evening sessions will be given over mostly to general discussions by the practical commercial growers in attendance. The formal addresses will deal with the practical application of scientific facts to production. The program is being arranged by Dr. P. A. Boncquet, county plant pathologist. Speakers invited are:

Geo. P. Weldon, consulting horticulturist, Ontario. "Deciduous Cultures and Pest Control."

Harry Smith, state horticultural commissioner, Sacramento, "Plant Pest Control."

Frederick Maskew, deputy plant quarantine officer, San Francisco. "The Practical Value of Plant Quarantine."

Geo. Compere, plant quarantine officer, San Francisco. "Introduction of Beneficial Pests."

Dr. Thomas F. Hunt, dean University of California school of agriculture. "What Prospective Settlers in This Section Should Know."

Professor Horne, department plant pathology, University of California, Berkeley. "Plant Pathology."

Professor Bioletti, department of viticulture, University of California. "Pest Control of Vines."

Professor Howard, department of pomology, university farm, Davis. "Summer Pruning."

Dr. Lipman, University of California. "Soil Bacteriology in Relation to Health of Plants."

CITRUS INSTITUTE

The summer meeting of the California citrus institute, scheduled for June 24 and 25 at the Elks Club House, Santa Ana, will discuss primarily the proper maintenance of mature citrus groves. Papers will be presented by practical orchardists giving detailed methods of tillage, irrigation, etc., in use on various soil types ranging all the way from the heavy clay soils of the Whittier region to the light gravelly soils of the Upland section. Ample opportunity will be given for discussion and questioning, so that the differences in operation on different soil types will be clearly brought out.

The report of the past two meetings of the institute has just come from the press and is being distributed this week to all members who have paid their dues. Annual dues in the institute are $2, and the report is distributed only to actually paid up members.

The banquet to be held on the evening of June 24 in the Elks Club House is one of the new features of this year's meeting. President Barrett suggests that so far as possible reservations should be sent in to the Orange County Farm Adviser, Santa Ana, before the date of the banquet.

VALLEY FAIR

The people of the rich little San Fernando Valley in Los Angeles County are planning for a fair and public sale of pure bred livestock to take place September 15-18. This is the week following the close of the state fair. The people of the valley are intensely loyal to their own section and propose to make this fair one of the milestones in its advancement.

DUST SPRAY FOR CITRUS

In a paper read before the Florida Citrus Seminar, by W. W. Yothers, attention is called to the value of sulphur applied as a dust in the control of the rust mite

Several experiments conducted by the author in 1918 corroborate earlier work and show that the effect of the sulphur upon the mite is practically instantaneous. Since the incubation period of the rust mite egg is about five days, the mortality will be complete if the interval between the dust application and the first rain is an equally great length of time.

Experiments on a fairly large scale in two fields are reported upon. Examinations made after application of dust consisting of 20 per cent hydrated lime and 80 per cent sulphur showed practically all mites to have been killed within one hour. The results show flowers of sulphur to be as effective as the finely ground mixture of sulphur and lime. So long as the sulphur was present it killed the young mites as soon as they hatched out. While one dusting was not enough to produce bright fruit, it is thought that two will be. It is concluded that dusting done during the hottest and dryest part of the day is in all probability equally as effective as when done while the foliage is wet with dew. It is said to be reasonably certain that a pound of sulphur is sufficient for a tree, and that a team and two men can dust 40 acres in a day. The approximate cost of treating 40 acres is placed at 4.7 cents per tree.

THE TROPICAL PAPAYA

J. E. Higgins, horticulturist of the Hawaii agricultural experiment station, in a bulletin entitled "The Papaya in Hawaii," says: "Excepting the banana, there is no fruit grown in the Hawaiian Islands that means more

Carica Papaya

Fruits weighing five pounds each, fruiting in a greenhouse, but without artificial heat except in coldest weather.

to the people of this territory than the papaya, if measured in terms of the comfort and enjoyment furnished to the people as a whole.

"The papaya is the almost universal breakfast fruit in Hawaii, enjoyed alike by rich and poor, and is recognized as one of the most wholesome fruits wherever it abounds. It grows so readily, with so little care, in such variety of soils and conditions, with so serious diseases or insect pests; occupies so little space and matures so quickly that it is to be found in nearly every dooryard and garden."

In California the papaya is regarded as a strictly tropical fruit, more so than the avocado or cherimoya, and is only planted in practically frostless localities. It must be said, however, that in favored spots it has fruited and that such fruits have been very good. The larger and better fruits, those weighing six or more pounds, have been grown under glass. A few trees have fruited in various parts of the south end of the state, out of doors, ranging from San Diego to Santa Barbara. In many places where frosts have not injured them the plants have died from "wet feet," the roots rotting from an excess of cold water during the rainy season. It is recommended to plant in the hottest place at command, on a little rise in ground or mound. The plant does not require as much water as the orange or avocado and as it is largely dormant during the rainy season, no drink need be given.—E. B.

THE WHITE SAPOTE

Casimiroa edulis, the white sapote, is a member of the same family as the orange, known to the botanist as Natural Order Rutaceae. It is also hardy as any orange tree and thrives under similar conditions. In fact, it has fruited in southern Europe and in its native Mexico grows at an altitude of 7,000 feet where the winters are quite severe. Therefore it is hardy throughout California.

The tree grows very slender when young and should be branched low, with several leaders, and these should then shoot upward uppruned. When the tree reaches some height it begins to branch and at 30 feet high is as much through the top. There is no other so-called tropical fruit tree that will endure so much drouth and general neglect. No amount of care lavished upon it appears to much improve growth of tree or quality or quantity of fruit.

It is better to plant it on well drained soil and give it an occasional irrigation in summer; never more than once a month. The terminal growths of young trees should be pinched out to induce them to branch. The fruit has a considerable range in size and quality, but budded trees are available. The best of these is the Harvey, the fruit ranging from three to four inches in diameter. In shape it somewhat resembles a quince, with the skin and flesh of a Bartlett pear. The tree, fruit, flowers and leaves all are in five parts, and by this the tree is easily recognized. It will not bear until seven or eight years old.—E. B.

GREEN MANURE DOESN'T SOUR THE SOIL

Turning under a green crop, even though it is nothing more than a crop of weeds, will nearly always increase the yield of crops raised on that ground during the next two or three years.

Some people have had the opinion that turning under green crops tended to make the soil sour, and would, therefore, make it unsuitable for some crops which do best on a sweet soil. This may be true in some cases, but experiments carried on in Virginia have shown that plowing under green crops does not always make the soil sour. On the contrary, the practice of turning under green manure seemed to make the soil less sour.

From these tests it would seem quite safe to assume that there is little, if any, foundation for the belief that green manuring makes sour soils. But even if it does, a little ground limestone will sweeten it again, and there is no question whatever regarding the higher crop yields from green manuring and liming, whether practiced together or separately.—Tractor Farming.

Twin City 12-20 Plowing 30 year old Alfalfa Sod

Here is a striking example of Twin City 12-20 performance. This picture from an actual photograph shows Twin City 12-20 near Montrose, Colorado, pulling three 14-inch bottoms through Colorado gumbo — 30-year-old alfalfa sod—plowing 8 to 10 inches deep in this toughest of all land. A feat not easily matched in tractor work.

With this demonstration of what Twin City 12-20 does under extraordinary conditions, you have ample assurance that it will give you any service you will ever demand.

Its 16-valve (valve-in-head) engine means great surplus power with fuel economy that you can see. Its unusual strength and light weight are the Twin City results from the finest alloy steels heat treated. *The Twin City 12-20 is built to do the work—not to meet a price.*

See the TWIN CITY dealer nearest you. Or write for details on TWIN CITY Tractors 12-20, 16-30, 25-45, 40-65, 60-90. All-steel TWIN CITY Threshers in three sizes and TWIN CITY Motor Trucks.

Here are some of the reasons:

Double valve area of 16-valve (valve-in-head) engine quickly exhausts all burnt gases, leaving a clean cylinder so that the new charges deliver full power. Removable cylinder walls mean uniform cooling, quick and easy replacements. Counterbalanced crankshaft reduces vibration and wear. Pressure feed oiling through drilled crankshaft. Hyatt roller bearings throughout. All gears of special alloy steel, drop-forged, heat-treated, completely enclosed and running in bath of oil. Every part readily accessible.

All Steel Twin City Threshers 22-42; 28-48; 36-60

"FIRE!"

In the dead of night. You awake choking. Flames bar your way to the children's room. "Mother! Daddy!" You hear their screams through the smoke. Will they escape? Your blood freezes. Will you escape? . . . . . Outdoors at last!—in night clothes. Midwinter—and freezing cold. No place to go. Sparks have ignited the barn. Horses and cattle kicking in terror. You try to lead them out. A stampede. Will you escape their hoofs?... No way to fight the fire. No one to help. Smoldering heaps of embers. Homeless!

DON'T LIVE IN CONSTANT FEAR OF CHIMNEY FIRES!

Do you know that three or four out of every ten farmhouses that burn are set afire by leaky chimneys? Do you know that a chimney without flue lining is the biggest fire risk on your place?

Heat dries up the mortar. Chemicals in the soot crumble it. The mortar falls out and leaves holes through which the flames start a fire in your walls.

Or the soot gathers on the rough places inside the chimney, catches fire and drops sparks on the roofs—or the wind carries them toward the barn.

Fire Clay Flue Lining fireproofs a chimney from bottom to top—*for a few dollars!* Its smooth surface does not gather soot. This reduces the chance of flying sparks. Also it saves costly chimney sweepings. And the smooth, clean, leakless flue causes the chimney to draw better.

Out where you have no real way to fight a fire and where a fire usually means a total loss, take no unnecessary chances.

Protect your family and your home with chimneys that are lined from bottom to top with Fire Clay Flue Lining.

Sold by building material dealers in sizes to fit all chimneys. Write for free booklet, "How to Build a Safe Chimney."

FIRE CLAY FLUE LINING

The Potato is King

By Ernest Braunton

AT San Gabriel the writer met a representative of one of Los Angeles' heaviest shipping firms, hunting for new potatoes on May 26, and finding none in that section. He said: "We are paying the grower $7 a hundred for any kind of potatoes and cannot find one-tenth what we need. Every available car is loaded with potatoes for Eastern markets. I don't know what is the trouble, altogether, but it looks as though California is feeding the other states."

This remark was made on the McSweeney ranch, standing in a ten acre patch of the finest White Rose the writer has seen, a very early and unusually vigorous lot, yet they will not be dug until about June 20. These have been cultivated at least four times, perhaps five, and will receive at least one more, and if another irrigation is found necessary, still another soil stirring will be given. It all depends on the weather. Potatoes were found in that section that had not been irrigated for two weeks previous to a day or two of hot weather, and the tender tips were sun scorched.

For Seed Purposes

The ten acres mentioned is but a part of 100 acres planted by the same grower, but on account of its excellence it will be "hill selected" for seed purposes. A large number of the best hills will be marked and the crop harvested by hand digging. If the crop in each hill prove up to the standard they will be kept and cured for replanting early in August, being kept out of the soil for at least a month. These potatoes have been twice sprayed as a precautionary measure, once in April and again in May. No trouble threatened, but the "ounce of prevention" was administered.

The spray used was the 5-5-50 Bordeaux mixture. It consists of five pounds of lime, five pounds of copper sulphate, and 50 gallons of water. To each 50 gallons is added four pounds of lead arsenate for any leaf hoppers or other insects that might come, the Bordeaux being used only to ward off possible fungus disease. The rows are planted three feet apart, but even now the plants practically cover all the soil with large bushy tops that come above one's knees.

Treatment After Harvest

After these potatoes have been dug and sacked they will be stacked in the shade of some large eucalypts, covered with three or four inches of straw and sprinkled twice a week if weather is warm, or at least every four or five days. This will cure them in four or five weeks so they will be in prime condition for replanting. The main points in seed potato storage are to keep them cool, dark, and not allow them to become too dry. In long storage for eating purposes the prime necessity is darkness. The field where this select ten acres of White Rose is growing will be irrigated, plowed and sown to melilotus some time in October, to be turned under in early spring. It is the practice on the McSweeney ranch to grow but one crop of potatoes on the land each year. The fall crop, like that now ripening, will be in about equal quantities of White Rose and British Queen—the acreage also about the same, or 100 acres for each crop.

Ten Acres of White Rose Potatoes

A remarkable growth on the McSweeney ranch, photographed May 25. Will be hill selected for seed.

Potato Field Meet

MORE than 200 potato growers and interested observers met at the ranch of J. L. Oleson near Van Nuys, on June 9, to inspect the several fields there and in the neighborhood, looking to crop production, fertilizing experiments, effect of cover crops, insect pests and diseases and all that pertains to commercial potato culture.

Potato Digger at Rest

Was turning out about 90 sacks to the acre, near Van Nuys, of very large potatoes.

Assistant Farm Adviser Gordon presided and introduced Mr. Oleson, who spoke briefly on what he had to present in the several fields—varieties used, treatment given, etc.—and invited those present to follow him through the fields to observe the various conditions he would point out. All started out in good faith and nearly all were "in at the finish," some decidedly "all in," for it was at least a four mile tramp over potato fields, covering two or more hours of time. But the crowd was willing and of good nature.

After return to the large shed, Mr Gordon introduced D. G. Milbrath, pathologist of the United States department of agriculture, who spoke briefly on potato troubles. He told of a few fields in poor condition where the ailments of plants were hard to define—a general lack of vitality. Near by were other fields given better care that showed less trouble. One field had been irrigated three times and cultivated seven times and in this one the plants were free from any trouble, proving proper care is the keynote to success. Fusarium may be largely controlled by proper irrigation and cultivation; the keeping of low temperature in the soil.

Mr. Gordon then introduced Farm Adviser Hodgson, who told of the advantages of organization, as many present had expressed the wish that a Los Angeles County potato growers' association might be formed. D. B. Mackie, field entomologist of the state department of agriculture, told of the depredations of the tuber moth and the best means for its control. No more speeches were made, but the following persons were introduced to the audience for a "once over": R. G. Risser, manager crop production department, California Vegetable Union; Roy E. Campbell, entomologist United States department of agriculture; J. H. Law, in charge of office of United States bureau of markets, Los Angeles

branch; H. E. Truax, investigator for same bureau; County Horticultural Commissioner Ryan and Deputy Neville, the latter in charge of rodent control; Dr. Clements, agriculturist of the Los Angeles chamber of commerce; and K. Okamoto, secretary of the Japanese Association of Southern California.

After this presentation of officials

Enthusiastic Visiting Potato Growers

Showing but one of the crowds of investigators in the fields of J. L. Oleson, near Van Nuys.

the crowd entered autos and visited several other fields, some where potato diggers were at work. To swell the crowd there were several classes of boys from surrounding schools, in charge of teachers in agriculture. The fields visited ranged from Van Nuys, through Owensmouth to Chatsworth. One of the most interesting phases of the meeting was the pointing out by Mr. Oleson of fields on which cover crops of various varieties had been grown, ranging in (1919) potato crops from 25 sacks to the acre to 225 sacks. The same lot of seed planted on new soil at Chatsworth yielded but 70 sacks an acre, but at Van Nuys, after two or three years of cover crops, the yield was 200 sacks to the acre. The first year following alfalfa the crop is much poorer than following vetch or other crops. Twelve tons of horse manure to the acre, with some bean straw, produced a bad case of scab throughout the field so treated. Mr. Oleson is seeking to eliminate scab from this field through use of cover crops, planting, of course, scab free seed potatoes. He has promised to tell Cultivator readers, in a future issue, about this and other interesting experiments with cover crops and fertilizers. Oats five feet high produced negative results, while on the adjoining field a vetch crop before potatoes produced a splendid yield of the latter. Mr. Oleson is now plowing under alfalfa and the field will be again plowed later and planted to autumn potatoes. When present crop of spuds is harvested, some of the fields will be sown to cover crops in August.

A FOOT OF ASHES

A report has just been made on the recovery of vegetation from the effects of volcanic ash at Kodiak. This is an account of conditions and processes in the region affected by the eruption of Mt. Katmai, Alaska, as regards vegetation and the revegetation of this area. Comparisons are made with other volcanic outbursts there and elsewhere. It is stated that the damage to vegetation by an eruption is not likely to be so great as at first appears, no permanent injury to agricultural interests being probable in cases where the ash fall is not greater than 12 inches.

BUD VARIATION IN POTATOES

In Poland, at the selection station near Warsaw, in fields of Early Rose potatoes, certain plants attracted attention by their great resistance to mildew during a time of heavy infestation. The plants were carefully saved, propagated and further observed. It seems that they were distinguished by another peculiarity—the terminal leaves as the young plants came up were observed to be shorter and more rounded at the ends. These characters the Polish investigators believe due to bud variation.

PROPAGATION OF POTATOES BY USING EYES

An experiment has been conducted by the agricultural director of the Ardeche (France) in utilizing as seed the eyes of potatoes with a very small amount of tuber adhering. At harvest time the plants produced were found to bear very small potatoes. Thus by using these very small pieces as seed, while there was a saving of five-sixths of the amount of seed (230 pounds per acre) there was a loss of 1350 pounds per acre on the harvest.

AMERICAN TOBACCO IN ITALY

The United States trade commission at Rome reports most unusual importations of American tobacco by Italy. In six months of 1918 we sent them 19,000,000 pounds and in the same months for 1919 there were arrivals of 42,000,000 pounds, an increase of considerably over 100 per cent. He adds: "It appears that American producers should be able to still further increase their sales to Italy, where it seems certain that the upward tendency of consumption will continue."

THE RICE BEAN

In Australia a few farmers have been using the rice bean, Phascolus calcaratus, as a summer cover crop or mulch with good success. This species is native to India and is sparingly cultivated for food both there and in China. It has also been grown in a small way, for trial, in the United States. Several Australian farmers who have given it three years' trial on steep stony ground praise it highly as a green mulch that prevents the washing of soils in times of torrential rains.

MEXICAN TOMATOES

The American consul at Nogales, Mexico, states that the steamship Mazatlan left that port on April 12 and arrived at San Pedro on the 17th, making the quick run of five days. The steamship carried 40,000 boxes of tomatoes, all it could carry of that class of freight. This shipment brought the tomato receipts from the state of Sinaloa above those of last year. He further states that two-thirds of the growers in Sinaloa are Americans.

A friend of M. E. Page of San Jose saw at far away Juneau, Alaska, a moving picture of Santa Clara prune orchards; gathering, processing and packing the fruit. The legend on the screen read: "California supplies 78 per cent of the world with prunes; the other 22 per cent don't eat 'em-"—Associated Grower.

DRIED VEGETABLES

Every year sees an extension of the commercial dehydration of vegetables, and in California we have such food factories from Siskiyou and Yuba Counties down to the south end of the state. Some of these dry nothing but potatoes, others mixed vegetables, and still others grind the latter and put them on the market under commercial brands, and for specific purposes.

One of the latter class recently inspected by a Cultivator representative puts out a powdered preparation consisting of dried and ground carrot, celery, onion, potato, spinach and turnip. It is used for making soups, salads, etc. The composition was readily given by the manager and an invitation extended to inspect the factory. The vegetables are dried by one of the common processes of dehydration and all are grown within a mile or two of the factory. This industry has been established about two years and ships to Canada and South America. It may be of general interest to quote the prices this prepared product brings at retail. The small packages are in four sizes, from ten cents for 1½ ounces to 75 cents for a one pound carton. In bulk the price for five pounds is $3.50 and for 15 pounds $10. The establishment has every appearance of prosperity and doubtless others will enter this promising field.

Champion
Dependable Spark Plugs

Did You Ever Lose a Dollar?

THAT is what it means to you when you drop and break a spark plug. At least one out of every twenty spark plugs is broken in one way or another. Figured on that basis Champion Spark Plugs with an annual output of over 25,000,000 save their users over a million dollars a year on breakage loss alone.

Our famous No. 3450 Insulator has been developed and strengthened to such a degree that car owners who use Champion Spark Plugs are free from spark plug breakage and from trouble due to heat, shocks and temperature changes.

There is a Champion Spark Plug for every type of motor car, truck, tractor, motorcycle and stationary engine. Order a set from your dealer today.

Be sure the name Champion is on the Insulator and the World Trade-Mark on the Box

Champion Spark Plug Company, Toledo, Ohio

The High Hay Market

THE high hay market is not your local market where hay is plentiful and consumed only in limited quantities. The high market is in the cities where 3,000,000 horses still compete with the automobile and motor truck — and eat hay. The city horse has no pasture or roughage to fall back on — he must eat feed and hay — 15,000,000 tons of hay yearly or one-fifth of the nation's total hay crop!

As a rule the demand for hay in the cities is greater than the supply and consequently the prices are high. Also, the city horse owner wants good hay and is willing to pay for it.

You can reach the high market with your surplus hay if you own an INTERNATIONAL HAY PRESS. International-baled hay is easy to handle — and the bales are neat, snug, and tight, and of uniform weight. They handle well for long distance transportation and successfully withstand rough re-handling in the city markets—solid, well-made bales that do not break easily.

You will be interested in the points of mechanical excellence that distinguish INTERNATIONAL HAY PRESSES—horse and power presses—from all others. There are economy reasons, too. Let us send you a descriptive catalog. Perhaps we can help you increase your hay profits.

Mariout Barley Scores in Butte County

Mariout barley not only has ripened earlier in Butte County this season, but has yielded a heavier production than common barley, according to the report of G. W. Hendry, assistant professor of agronomy at the University of California farm, and H. E. Drobish, farm adviser of Butte County. After an inspection of the 30 Butte County Mariout demonstrations last week, the following report was made:

'Mariout on the Geo. E. Canfield ranch, three and one-half miles west of Chico, was practically ripe on May 21, while common barley was just filling and was in danger of pinching as a result of the north wind.

"On the ranch of John H. Guill Jr., two miles east of Chico, Mariout barley was so far advanced that it was not pinched by the north wind of May 19, 20 and 21, and Mr Guill estimated that it would outyield common barley by about 50 per cent on his drier, higher lands.

"An estimate of ten sacks of Mariout barley per acre was made after inspecting on May 21 a piece of shallow hardpan soil eight miles north of Chico, near Rock Creek, planted by Arthur Smith and C. V. Richards. This land was selected in order to provide the severest test possible. Common barley has never produced on this land.

"Mariout planted by R. W. Durham of Durham, February 25, was in the "dough" and still green and thrifty May 22, while common barley planted at the same time was in the boot and had not started to fill, and was in a less thrifty condition. Others near Gridley who had good fields of Mariout were Fred Hackett, C. S. Cliffman, S. A. Mealey, C. W. Van Note and E. S. Porter."

World Cotton Conference in 1921

Advice has been received from Rufus R. Wilson, general secretary of the World Cotton Conference, who is now in England for the purpose of conferring with other officers of the conference, that the date of the next meeting has been fixed as June 13 to 22, 1921. The sessions of the first three days will be held at Liverpool. The delegates will then proceed to Manchester, where the remaining sessions will be held.

The conference to be held in England bids fair to surpass any gathering in the history of the industry, not only in point of attendance, but in the scope and importance of its work. The first World Cotton Conference, held at New Orleans last October, was a distinct success. Much was accomplished at that time; close and cordial relations were established through mutual intercourse and personal contact; a spirit of hearty cooperation was aroused; the body became a permanent organization, with a definite purpose, and the wheels were set in motion for real achievement in the solution of the many problems now facing all cotton interests. The next conference will bring to its task a perfected organization, committees whose work is definitely outlined and an enthusiasm born of the knowledge of the power of coordinated effort and the cooperation of those who firmly believe that the welfare of each unit is best served by that which benefits the industry as a whole. Arrangements are rapidly taking form for a program which will be of vital interest to all engaged in the production, handling and manufacturing of cotton and its products,

Nor have arrangements for the enjoyment of the delegates and their guests been neglected. The last day at Liverpool and two days during the Manchester meeting will be entirely devoted to their entertainment. Steamship and train arrangements for the entire trip are in the hands of the Eaves Steamship and Tourist Agency of Boston, which has been appointed transportation manager by the executive committee. Very attractive itineraries are now in preparation for those who desire to extend their travels to the continent after the conference.

Broad Bean Weevil

Roy E. Campbell, in Bulletin 807 of the United States department of agriculture, says: "Infestation of the broad or horse bean in California by Bruchus rufimanus has resulted in a reduction of dry beans for market from 200,000 bags to the present production of about 50,000 bags. It is pointed out that only about 30 or 40 per cent of the crop is used as stock feed, the larger portion being shipped to New York and other Eastern cities, where it is used for food by Italians and Portuguese and is known as fava. The principal broad bean sections in California are around San Francisco Bay and down along the coast to a little below San Luis Obispo. This weevil was first recorded as established in the United States in September, 1909, having been found by I. J. Condit at San Luis Obispo.

"Life history studies show that there is but one generation of the weevil each year and that it does not breed in dry beans. The eggs are laid on the green pods in the field from the middle of March to the middle of May. The larvae reach maturity from August to October, while adults can be found from August to the following June. The egg stage is from nine to 18 days; the larval stage, ten to 15 weeks; the pupal stage, seven to 16 days; and the adult stage, one to eight months. Germination of infested beans was found to be from 20 to 40 per cent less than that of uninfested beans. Germination of seed a year or more old is only slightly less than that of new seed.

"There are no natural enemies of the broad bean weevil of any consequence in America. It requires 170 to 180 degrees Fahrenheit for over half an hour to kill all of the weevils in broad beans. Sulphur is unsatisfactory as a fumigant. Carbon disulphid at the rate of seven pounds per 1,000 cubic feet in a tight box for 24 hours kills all the weevils. In seed held over until the second year all the weevils are dead. Beans from crops planted late, after March 1, are much less infested than those planted earlier, from November to March."

LAND HOLDINGS IN CALIFORNIA

The California commission of immigration and housing has issued a report for 1919 for which have been compiled from the tax records various facts regarding holdings in the eight southern counties:

Some of the findings are that in the eight counties of Southern California there are about 25 holdings, each of more than 2,000 acres; that the Southern Pacific grant lands and lieu lands in five of these counties aggregate 2,598,775 acres; that 50 per cent of the "lands in farms" are owned in about 250 holdings; and that there are at least 32 holdings each of more than 15,000 acres, seven of which exceed 50,000 acres each, one of which is of 101,000 acres, and another of 183,399 acres. Remedial suggestions offered include the extension on a large scale of the plan of the land settlement board and the adoption of a graduated land value tax.

ASK TOBACCO COMPANIES' AID IN FOREST FIRE PREVENTION

Because of the very serious fire hazard created by tobacco smoking in the forests, E. T. Meredith, secretary of agriculture, has asked tobacco companies to enlist smokers in a campaign against careless use of fire in all forests, both national and private. The suggestion is that the tobacco companies include in tobacco packages brief printed legends urging smokers to take every precaution to prevent the spread of fire from matches or burning tobacco. This has

been done by a Canadian tobacco company.

This is one feature in a movement now being carried on by the forest service to lessen the number of fires caused by smokers and others while working or enjoying outings in the forests.

The secretary writes:

"In protecting the national forests of over 150,000,000 acres, the department of agriculture has to fight thousands of forest fires every summer due to carelessness. Smokers cause many forest fires. Some lumber companies forbid smoking in the woods, and the extension of this rule is being strongly urged. Such measures would never have been considered necessary if smokers sufficiently recognized the danger that attends the dropping of a lighted match, a pipe coal, or an unextinguished cigarette or cigar stump.

"Hunters, fishermen and woods workers of all kinds smoke in the forests, while automobilists toss a bit of fire from their cars and speed thoughtlessly on, unaware that they have left an incipient conflagration behind them. A single glowing cigarette end may cost the government thousands of dollars for fire fighting, to say nothing of the value of the timber destroyed, the desolation of scenic beauty and the harm done to water flows.

"It is not enough to bring the importance of fire prevention to the attention of an individual once or twice. The warning to use caution needs to be so drilled into his consciousness that care becomes habitual and instinctive."

MAGIC OIL

John K. Barnes quotes from Franklin K. Lane in the June World's Work as follows:

Oil draws railroad trains and drives street cars. It pumps water, lifts heavy loads, has taken the place of millions of horses and in 20 years has become a farming, industrial, business and social necessity. The naval and the merchant ships of this country and of England are fitted or are being fitted to use it either under steam boilers as fuel or directly in the Diesel engine. The airplane has been made possible by it. It propels that modern juggernaut, the tank. In the air it has no rival, while on land and sea it threatens the supremacy of its rivals whenever it appears. There has been no such magician since the days of Aladdin as this drop of mineral oil.

POTATOES FROM CANADA

Under date of May 4, 1920, Consul Johnson, at Ontario, Canada, reports: A large portion of the available potatoes in Ontario province is finding its way to the American market. American buyers are paying $5.50 per bag (90 pounds) f. o. b. Ontario points, and will take any amount that is offered and are glad to get them. Ten carloads recently left a Canadian town for an American center and 12 more carloads a few days later.

The only reason that large quantities are not being shipped is due to the railroad strike, which is causing shipments to be held at border points and, in a way, is practically an embargo. Apparently the lack of transportation has had no effect upon the American buyers who are operating in Ontario. As to the quantity still available, nothing definite can be learned.

A shipper stated that by sending potatoes to the United States he benefited by the rate of exchange. "American buyers," he remarked, "come into our warehouse and offer $5.50 per bag, and even buy cars at that price without touching them. They pay the cost of the potatoes and also prepay freight in American money. The exchange on a bag at the present price is around 60 cents, and as a car contains about 450 bags, the profit on the car in exchange is about $250. In this way we are able to make a little profit."

Central California Fruit Workers Union of the federation of labor will move its headquarters to Fresno because of the coming peach and grape harvest.

NEW USE FOR BAMBOO

Owing to the world wide shortage of paper the subject of raw material is an interesting one and claiming much attention. Sir Harry Johnston of England, a well known explorer and scientist who has spent many years in British Africa, suggests the use of the rank growth of tropical grasses which cover so much of the "Dark Continent." But William Raitt, consulting cellulose expert to the government of India, says that the same grasses grow in India and have been largely experimented with. He states that bamboo is the most promising new material. Experiments have proven no practical difficulties attend the conversion of bamboo into paper pulp. The supply is practically unlimited in India. A crop is produced annually, and transportation facilities are good, many of the sources of supply being on tidal water.

NO CRUDE CAMPHOR

The United States has admitted crude camphor free, to encourage refining works at home, and has placed a substantial duty on the refined product. Consul Hitchcock cables from Japan under date of May 25 that the Japanese government, to assist the camphor refiners of Japan, will stop all exports of crude camphor to foreign countries. This should prove a boon to Florida, where some commercial camphor has already been produced. While the California climate is too dry for the rapid production of camphor wood, the cutting off of the crude camphor supply may encourage the setting out of camphor tree plantations in the cooler and more humid coastal districts.

PLANT DISEASES

From experiments made in Ontario, Canada, Bordeaux mixture appears to be of little utility as against onion blight. Combined with 40 per cent nicotine sulphate, it gives hope of controlling celery black heart through its destructive effects on the tarnished plant bug, which is believed to be responsible for injury leading to infection resulting in this disease. Lime-sulphur dust and lead arsenate in dust form applied over a limited potato area gave an increased yield of cleaner and larger tubers. The use of dust mixtures is recommended for celery blight, but formalin was not successful after this disease was once well started.

FAIR DATES

Sonoma County Fair, Santa Rosa, August 25-29. Secretary J. Francis O'Connor.
Patterson Fair, Patterson, August 26-28. Secretary T. J. Moe.
California State Fair, Sacramento, September 4-12. Secretary Chas. W. Paine.
Tulare County Livestock and Agricultural Show, Tulare, September 14-18. Secretary John A. Rollins.
San Fernando Valley Fair and Market, Owensmouth, September 15-18, Secretary Chas. L. Schufeldt.
Kings County Fair, Hanford, September 21-25, Secretary Frank C. Russell.
Ventura County Fair, Ventura, September 22-25, Secretary L. P. Hathaway.
Glenn County Livestock and Agricultural Association, Willows, September 27-October 2. Secretary E. A. Kirk.
Fresno District Fair, Fresno, September 28-October 2, Secretary Walter C. Fickiin.
Los Angeles Livestock Show, Los Angeles, October 2-10, Secretary C. R. Thomas.
Siskiyou County Fair, Yreka, October 5-9, Secretary Claude R. Gillis.
Southern California Fair, Riverside, October 13-19. Secretary W. W. Van Pelt.
Western Royal Livestock Show, Spokane, Washington, November 1-5. Secretary Bert L. Hilborn.
Pacific International Livestock Show, Portland, Oregon, November 15-19.

Service As Convenient as the Village Blacksmith Shop

If you had to send your horse 500 miles to have a new shoe put on, you'd think it quite a hardship. Then why use an engine whose ignition system must be sent a long distance when in need of attention?

With a Bosch High Tension Magneto supplying the ignition spark, you have no cause to worry. It's by far the most efficient and dependable ignition system. It probably won't need attention for years, but, if anything *should* go wrong, you're always within easy reach of one of 300 Bosch Service Stations. Bosch Service men are experts, too—factory trained, careful and courteous. They guarantee their work.

Avoid delays, expense and trouble by insisting on Bosch Magneto Ignition when buying an engine. You can install a Bosch on the old engine, too, whether its on a car, tractor, truck or power-plant. There's a Bosch Representative near you who can make the change.

Be Satisfied *Specify Bosch*

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Onion Sets

I planted a large seed bed to onions of the California red variety, last August, but didn't transplant them. Now I am harvesting a nice lot of onion sets, in size from a butter bean to large marbles, and some large enough for pickling. If I should set them out in field this fall, will they make large onions, or will they go to seed? How many will be required to acre?—L. H. B., Lathrop.

All onions less than an inch in diameter may be planted and will make large onions, as they contain but a central shoot. Those larger contain two or more and will make dividers or split onions. It is better, therefore, to sell those of one inch or more as pickling onions, planting only the smaller ones. About 250 pounds of sets are usually planted on an acre.

Apricot Pruning

We have an apricot orchard about seven years old that has not been pruned right—cut back too much and not thinned enough. We intend to summer prune this after this crop is off. What will be the best time and will it harm the trees if the larger limbs are cut out during summer?—H. G. B., Bakersfield.

Summer pruning after the crop is off is not best where large limbs are to be taken out or in any case where the trees would be robbed of large numbers of green live leaves. The latter are all needed to finish wood growth and store plant food. When they have ripened and are turning color and falling off the pruning may be done.

Lung Worms

What shall I do with my calves? They have lung worms, and what is the cause?—Subscriber, Holmes.

Unfortunately there is no very satisfactory remedy. Prevention is practically the only procedure for the stock still uninfected. Diseases of Cattle, issued by the department of agriculture, page 535, reads: "Treatment for lung worms: Various treatments have been advocated for lung worms, including fumigating with different substances and injections of remedies into the trachea by means of a large hypodermic syringe or by a special spraying apparatus, but none has been very successful from a practical standpoint. About all that can be done is to feed affected animals well and protect them from exposure, removing them from the pasture and keeping them in dry yards or stables maintained in a cleanly, sanitary condition." Methods of prevention are discussed in the same book, on page 525, as follows: "Cattle become infected with these parasites by grazing on pasture in which infested cattle, sheep or goats have grazed and scattered their droppings. The worms in the stomach produce a multitude of eggs of microscopic size, which pass out of the body in the feces. In warm weather these eggs hatch in a few hours. If the temperature is below 40 degrees Fahrenheit, they remain dormant, and if below freezing, they soon die. The eggs are also killed by dryness; moisture, on the other hand, favoring their development."

Avocados on Land Subject to Frosts

I have 20 acres of river land with very light soil; in fact, sandy; no alkali. Frosts very hard. Would this be desirable for avocados?—Subscriber, Kern County.

No, we do not think avocados would do well under these conditions. The most successful plantings of avocados we have seen have been on high lands which are almost frostless. They are more susceptible to frost than the orange or even the lemon.

Number of Hens in Pen

How many hens are required to make a pen?—Subscriber, Del Mar.

For exhibit at fairs, one male and four females constitute a pen, and in an egg laying contest a pen consists of five laying pullets or hens with one reserve.

Growing Onions

Can onions be grown successfully on sandy loam soil without irrigation, and, if not, how often is irrigation necessary and at what time of the year should the sets be planted to mature in March or April?—Subscriber, Del Mar.

As onions to market in March or April should be set out in late September or early October, it will doubtless be necessary, and best, to irrigate before planting and immediately afterwards. Winter rains should keep up the water supply; if not, one must judge by soil conditions as to when irrigation is needed. The sandy loam mentioned is the best of soils for onions if it has been sufficiently enriched.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Inheritance Right

I married a man having several different pieces of real estate. Upon one of these we have resided. All of the property was his prior to marriage. Have I the right to file a homestead upon this property upon which we reside? In case of my husband's death, what would become of property homesteaded and what would become of the remainder of the property, if there were no will? There are no children.—Subscriber, Owensmouth.

If the claimant be married, the homestead may be selected from the community property, or the separate property of the husband, or, with the consent of the wife, from her separate property. If the selection were made from the community property or from the separate property of the spouse making the selection or joining therein, the land so selected, on the death of either of the spouses, vests in the survivor, subject to no other liability than incumbrances actually existing against the homestead. In case the husband does not join in the selection, then upon his death it goes to his heirs, subject to the power of the superior court to assign the same for a limited period to the family of the decedent. In the case stated, the property being all separate property, upon the death of the husband without issue, one-half of the property would be distributed to the wife, the other half in equal shares to the father or mother, or, in case of their decease, to the brothers and sisters of the decedent, or his other next of kin.

Childless Intestate

A married man with no children dies and leaves no will. What disposition is made of the property?—Subscriber, Manteca.

In case the property was community property, one-half thereof goes to the surviving wife and the other one-half is subject to distribution in the same manner as the separate property of the husband. The separate property of the husband goes one-half to the surviving wife and the other one-half to the decedent's father and mother in equal shares, and if either is dead, the whole of said half to the other. If there is no father or mother, then such one-half goes in equal shares to the brothers and sisters of the decedent and to their descendants, or in case there are no brothers and sisters or descendants thereof, then to the next kin in equal degree.

Partition Fence

Two parties own land adjoining. What is the law as to the partition fence? If one party wishes to leave a driveway on his side, does that excuse him from maintaining and putting up of a partition fence? Who is required to put up and maintain partition fence?—Subscriber, San Bernardino.

There is no requirement of law that anyone put up or maintain a partition fence, except the following provision:

Co-terminous owners are mutually bound equally to maintain the fences between them, unless one of them chooses to let his land lie without fencing, in which case if he afterwards encloses it, he must refund to the other a just proportion of the value at that time of any division fence made by the latter. Such a division fence having been established, it is probably true, under the law of easements, that each owner has the right to have the other bear his just proportion of the expense of maintaining such fence. It would make no difference what disposition a person chooses to make of his land, whether he wishes to make a driveway or not, as to his obligations with respect to such fences.

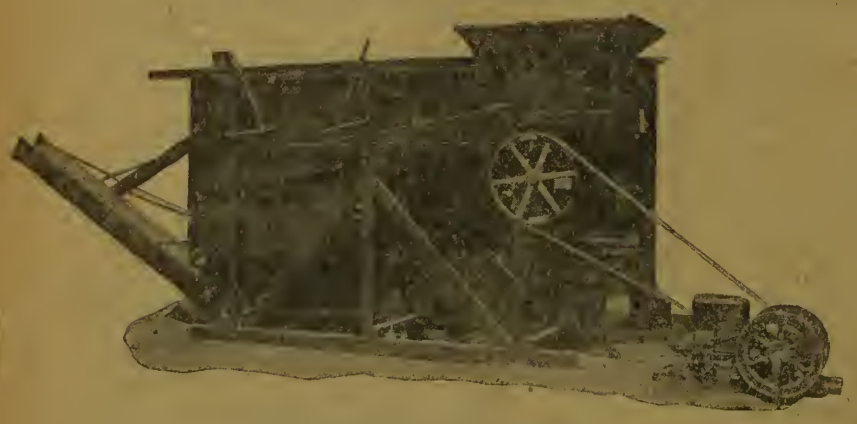
BEAUMONT CHERRY DAY

The Beaumont cherry day celebration of June 10 resulted in a fine showing of cherries and other fruits. An attractive showing of several hundred boxes were placed on display by M. P. Chubb, R. Le Beau, R. L. Wilson, K. P. Boulton, Philipp Truby, G. E. Turner, F. A. Curtis, J. D. Funk and the Beaumont Fruit Growers Association. An additional display was neatly arranged at the corner of Fifth and Egan streets by Frank More, a leading grower of the valley.

Visitors were entertained by the Beaumont military band, the March Field aviators' exhibition flight, an address of welcome by K. R. Smoot, sports and games.

The acreage of Beaumont Valley includes about 13,000 acres of apples, apricots, almonds, cherries, grapes, nectarines, olives, pears, peaches, prunes, plums, walnuts, hay and grain.

Almond Huller



Manufactured and Patented by
L. K. VAUGHAN, 172 Elm St., Woodland, Cal.

Some Smiles For The Farmer

Have you seen the Almond Huller that don't wear out the fingers and you don't have to stand at the stacker and see the meats going into the hulls as loss? With this machine you can hull or crack all the nuts and no waste at all and have time to go to all the fairs and no worry. Write for any information. 1 1-3 tons in 10 hours guaranteed. Price $385.

More than half the cars on the Coast—

More than half the motorists of the Pacific Coast states use Zerolene. Such approval is given only as a reward to a product of highest quality. Use Zerolene for the Correct Lubrication of your automobile, truck or tractor.

STANDARD OIL COMPANY (California)

NITRATE OF SODA ON CITRUS FRUITS

By William S. Myers

The citrus in California needs humus, nitrogen and phosphoric acid. Nitrate of soda may be used at the rate of 400 pounds to the acre broadcast, in February or in March. An application of 400 pounds of acid phosphate may be put on with the nitrate or earlier. The use of barnyard manure and cover crops is recommended for securing a supply of humus.

The natural capillarity of soils, doubtless, is in most instances a powerful factor in helping to retain the readily soluble elements of fertility, otherwise all the fertility of the world in our humid regions would, in a few seasons, run off into the ocean and be permanently lost. This is mentioned on account of certain statements to the effect that it would leach away. The thousands of tons of soil in an acre of land has a powerful holding capacity for all the useful, available elements of fertility. Of this soil 2,000 tons from the part usually subject to cultivation might be called service soil.

Whilst the price of nitrate of soda per ton may seem relatively high, its value should be judged by the availability of its nitrogen, which is complete—that is to say, all the nitrogen in nitrate of soda is usable.

The main question for the grower is how to secure the most effective form of nitrogen at the lowest cost per unit of this available material—the most important of all his fertilizers.

We recommend the use of leguminous cover crops, or alfalfa hay or manure in connection with nitrate of soda.

The best results from the use of nitrate of soda are always secured by thorough cultivation. The longer and more continuously the soil is worked during proper periods the better; and each succeeding year brings better crops, where soils are thus treated; in other words, we believe in continuous, intensive cultivation.

Nitrate cannot take the place of intelligent soil management, which includes a liberal but judicious water supply, proper cultivation and the use of phosphate.

HINTS FOR PRUNING

Professor Longyear of the forestry department of Colorado agricultural college gives points to remember when pruning trees. They are enumerated as follows:

Proper pruning gives more and better fruit.

It costs less to spray and pick a well pruned tree.

All varieties are not pruned alike.

Heavy pruning tends to increase wood growth and may be used to rejuvenate a run down tree.

Light pruning tends to increase fruit production.

The growing habit of a tree varies with age.

Water sprouts are usually the result of heavy pruning. Those sprouts near the base of the scaffold limbs may be tipped back and caused to produce fruit.

A limb grows more from the tip buds than from the lateral buds.

Fruit may be thinned by pruning.

Keep the top of tree somewhat open. Light helps to make extra fancy fruit.

If the buds on your peach trees have been killed and the fruiting wood is in the upper third of the top, "dehorn" your trees back heavily to limbs one inch in diameter.

Learn the principles of pruning, the details will vary with the tree.

Common sense and good judgment will help a great deal.

VACANCY AT WEST POINT FOR CALIFORNIA MAN

One cadetship at the United States military academy, West Point, is open for some young man of California. California's junior senator has been requested to nominate a candidate who can qualify by certificate for admission on July 1, 1920, it being too late to hold another entrance examination this year The law requires that the person appointed shall be an actual resident of the state from which he purports to be appointed.

According to Colonel John T. Nance, commandant at the state university, application for appointment should be made by wire, followed by letter, directly to the senator or representative who has the vacancy at his disposal, and in view of the very short time remaining before the admission of the next class, application should show full name, date of birth, residence, and educational and other qualifications Unmarried men between the ages of 17 and 22 years of age are eligible. Ex-service men who served one year during the war are eligible until 24.

DEMONSTRATION IN FIGS

A demonstration of fig growing, packing, even culture and pruning, will be made in the orchard of W. Sam Clark at Sultana, Tulare County, June 20. Invitations have been sent to fig enthusiasts in all parts of the state.

Mr. Clark says: "There will be a complete exposition of the subjects of pruning, picking and packing of figs during the day, and the occasion is one offering such opportunities for securing first hand information on these points that it is expected a large number will attend. The harvesting of the first crop of figs will be in full swing and guests on that day will be privileged to help themselves to all the fruit they can eat."

Mr. Clark is an enthusiastic grower of the Kadota.

ELECTROCULTURE OF POTATOES

Two years experiments on potatoes in Wales, in a heavy loam soil, using a network of No. 24 steel wire with meshes six feet square and straight wires nine feet apart, suspended five feet and two feet above the plat, are reported. A current varying between 30,000 and 39,000 volts was used. Treatment was usually given between the hours of 6 and 9 in the morning and 7 and 10 in the evening. During the first year a total of 282 hours treatment was given and during the second years 588 hours. An increase in yield of 17.2 per cent was obtained the first year and 12.6 per cent the second year. It was noted that in both years the potato stalks kept green much longer under the network than in the control plats.

USES FOR WINE GRAPES

F. T. Bioletti and W. V. Cruess have suggested various ways of utilization of vineyards now planted to wine grapes. The methods proposed and listed here are of four types: shipping the fresh grapes to countries which do not prohibit wine making; utilization of grapes for other purposes, such as raisins, for home wine making; grape juice, grape syrup, vinegar, grape sugar, cream of tartar, etc.; grafting the vines with raisin and other table varieties; and replacing the vines with other crops.

MRS. JOHN KILLEFER

Nearly every soil tiller who has had occasion to use subsoilers and other power implements has become acquainted with one of the pioneer manufacturers, John Killefer. These friends will sorrow with Mr. Killefer in the death of his wife, who lost her life in an auto-electric car accident on the Coyote Pass road last week. Mr. Killefer was driving the machine and he was so seriously injured that he has as yet not been able to give any account of the accident. His recovery is now considered certain.

The Tulare County Canning Peach Growers Association will control in its "peach pool" over a thousand tons of freestones and about 800 tons of clings. They have been sold at $60 for the freestones and $100 for the clings.

HUDSON SUPER SIX

Hudson Fineness Equals Its Matchless Performance

Aside From the Supremacy of the Exclusive Super-Six Motor, Its Beauty Gives Distinction in Any Field of Fine Cars

Hudson has unremittingly kept the issue of performance to the fore. Not simply because its mastery is indisputable.

Rather because this question is vital above all. It must always be so. It must always be the measure of any car's title to worth.

Hence undue emphasis has never been placed on Hudson's four years' leadership in fine car sales. Largest sales are not infallibly proof of greatest merit. Hudson has no need to offer them as such.

Yet their importance cannot be overlooked. Here is the massed opinion of far the greatest number of owners of any fine car in the world. Some are driving the earliest Super-Sixes built—now more than four years old. Some acquired Hudsons but recently. But how unaminously they hold no car can rival it.

What 90,000 Owners Know First Hand

Those who have had their Hudsons longest are perhaps its most emphatic champions. They know it best. They have seen it pitted with triumph against every situation that can confront an automobile. Today their Super-Sixes are giving service, such as is literally beyond the performance capacity of many new cars that cost more.

Certainly no fine car is so highly regarded by such a large following.

See What It Has Done

Were its position less deserved could Hudson hold the loyalty of all these? Were its supremacy less decisive, surely five years must have discovered the rightful successor.

But time only brings fresh evidence of Hudson leadership.

In speed—in power—in acceleration—in hill-climbing, it has never been matched.

The most abusive tests to which a car was ever subjected have failed to find its endurance limit. Could other types adopt it, they might share Hudson's unmatched ability. But Hudson controls it. By right of invention Hudson alone can use it.

It will not be possible to supply all who want Hudsons. So even though you may not want your car for several months, now is not too early to place your order.

Hudson Motor Car Company, Detroit, Michigan

There's Just One 100% Efficient

CREAM SEPARATOR

And That's The

DE LAVAL

For Forty Years

The World's Standard

There may be a half-dozen plows, wagons, tractors, autos or other farm equipment to choose between, but no would-be imitator or utilizer of expired De Laval patents has yet produced a cream separator comparable with the De Laval.

First in the beginning, De Laval machines have led in every step of cream separator improvement and development. Every year has presented some new feature or betterment, and the 1920 machines are still better than they have ever been before.

If you haven't seen or tried a new 1920 De Laval machine, any local agent will be glad to afford you the opportunity to do so.

If you don't know the nearest De Laval local agent simply address the nearest main office, as below.

DE LAVAL DAIRY SUPPLY CO.

THE LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST

61 Beale Street San Francisco, Cal.

The Bargain of the Entire Year

Owing to sickness in the family of my partner, I am forced to dissolve the business, and am offering without reserve my entire herd of

Big Type Poland Chinas

Including My 1920 Show Herd

Among the individuals offered are the following: Black Beauty C., first prize Jr. yearling and Reserve Grand champion sow at Sacramento in 1919, with futurity litter of nine pigs sired by Long Big Bone Jr., the junior champion in 1918.

Perfect Beauty, by Long Big Bone Jr., and out of Black Beauty C. This is one of the most promising yearling sows in the state.

Whizzer, a litter mate to Perfect Beauty and my boar candidate for junior yearling honors.

A junior yearling sow sired by Orange Boy, that cost me $500 in the East last winter.

Tim Jones by Fissy's Tim and out of an F.'s Big Jones sow. This is one of the best individual and breeding boars I ever owned.

This ad will only appear twice, so act at once if interested. Now is the time to build for the future.

The Shire as An Improver

W. G. Lynch, Secretary of the American Shire Horse Association

THE outstanding merit of Shire stallions to produce a horse of superior merit when mated with grade stock is becoming more and more widely recognized. The admiration for the Shire is not confined to breed enthusiasts and those who produce grades. This is attested by an experience recently reported. It happened that three stallions of one of the popular breed, owned on one of America's famous farms, were being shown to a party of visitors. One of the three was a noted sire, one was a young horse that had won fame in the show ring while the third was a recent addition to the herd. The man in charge of the stallions remarked confidently to a friend of his in the party concerning the third. "This is the one that will prove to be the real sire. He is very much like a Shire. He has the size, the massiveness, the ruggdness and the powerful way of going combined with a masculine appearance which I have found necessary in a sire." The horseman who made the remark had had a wide experience and opportunity to observe in Illinois, Minnesota and other states.

Shire stallions are outstanding useful in present day horse affairs. They sire good horses. In every community where Shire stallions have been kept there are always good horses to be found. Buyers of geldings for big teaming concerns hover regularly in communities where sires of our great breed have been on the stand. Buyers seeking geldings to make up the great six horse exhibition teams go first to the localities where they can look over the progeny of the great and massive and attractive Shire. Buyers for the circus make annual pilgrimages to those communities. John Truman, president of the American Shire Association, himself one of the closest students of blood lines is authority for the statement that scarcely a gelding of great prominence has appeared that did not carry a large proportion of Shire blood. Some, he says, which were claimed by other breeds were far stronger in the blood of the Shire than they were of the breed so anxious to stand sponsor for them.

There is a market for every good Shire. This is equally true of grade or purebred. Such being the situation during this temporary depression, we may depend upon wonderful prosperity for the same lines of stock when the horse market shall again come to its own. It is said that the real test of a man is for him to go through ill luck and depression. Likewise with the horse, the one that goes through an extended period of lack of excitement such as we have experienced during the past five years deserves our greatest commendation. The Shire has gone through all this period and stands forth ready to continue to do his part in bringing livestock progress and prosperity. We are proud of the Shire horse. During the past five years some weeding has been done. Many of the inferior ones have been culled out and as a result the average excellence in our breed is undoubtedly higher than ever before. Shire stallions are widely distributed in all the best horses producing states. Any desiring to breed to a Shire may rest assured that the offspring will be meritous and profitable.

The Hog in California

By T. J. Hitte

THERE is nothing more conspicuous in the livestock situation in California today than the shortage of hogs. In casting about for a reason one is confronted by a peculiar combination of circumstances and conditions, some of which, at least appear as plausible drawbacks through the setting forth of much technical information at the command of the packing fraternity. Reference is had to the matter of price in the California markets as compared with the scale of prices obtaining in the big markets of the Middle West.

To the close observer it should appear that the real, if not only, handicap experienced by growers of hogs in the Pacific Coast territory is to be seen in this disparity of prices, showing a wide margin in favor of the hog that is marketed in the older hog growing country under conditions that should and do inspire a keener competition among buyers.

Assuming that here is to be found the gist of the trouble with the pork growing industry in California, it behooves every thinking man and woman in the state to lend aid to a campaign, whose purpose shall be to grow hogs in sufficient numbers to supply our own domestic needs, in numbers that shall challenge the attention of the packing interests of the state, and in numbers that shall put the pork making industry on a par with other great agricultural interests throughout the state.

There is today no question in the mind of any man who has had opportunity to observe feeding operations up and down the state, as to the feasibility of growing out and finishing a type of hog here that will compete with the best type of corn fed hog in any part of the country. The economic factor is certainly in our favor even at the outset. It is to be readily admitted that a pig does not thrive continuously on California scenery, nor on California climate, though the latter is to be accounted a real factor in the pork making industry of the state, and one whose importance can only be fully realized as the magnitude of the industry expands to proportions in keeping with the needs of the state.

In this climate the pigs are saved in larger numbers at farrowing time; two litters per year per sow are to be figured as the regular order of things; the pigs are grown out more economically because of no hitch in their development owing to extremes of weather conditions; and there is no country in the world that can supply a more efficient or more economical feed ration for the brood sow, for growing pigs and for fattening hogs, than that furnished through the fertile fields of our own state. In view of all the various foregoing favorable factors, it should be considered the duty of producers and consumers alike to speed the day when the state of California shall be working to full capacity her pork making industry.

Since the spirit of cooperation among the farming classes of California is so well set, it is a safe assumption that any feature of livestock enterprise taken in hand by the rank and file of farmers over the state is destined to succeed even beyond the most sanguine expectations of those who should know best. If there is a lingering doubt in the mind of any person familiar with California conditions today as to the permanency of the state's hog growing industry, as seen from the viewpoint of its infancy, that doubt should be dispelled through a comprehending sense of the unanimity of forces back of the industry today.

Foremost, perhaps, in this good work is that of the average county farm bureau, having for its cardinal principle an active everyday service in behalf of the movement to grow more and better hogs. Then there are the state and county breed associations, each, of course, playing its own special favorites, but none the less agressive in behalf of the general theme of swine promotion. Every professional breeder of pure bred swine in the state, whether in large or small degree, is an ever active agency making for improvement in type and quality of hogs grown. The state, district and county fairs constitute a powerful factor in deevloping the swine industry through well defined plans for creating competition in the show yard, as well as affording opportunity for the public to form its own opinions as to the relative merits of the various breeds on exhibition.

As an indication of the way in which the industry is taking a fast hold upon the average farming community in this state, it may be mentioned that there are now probably no less than half a hundred breeders of pure bred swine in the San Fernando Valley alone, and at the same time it is to be borne in mine that this valley is one of the newest and richest fruit growing sections of the entire state.

It all leads up to the inevitable conclusion that the great American hog is already a fixture in the mixed farming order of things hereafter to prevail in California.

SALINAS VALLEY DAIRYMEN'S PICNIC

The dairymen of the Salinas Valley and their families to the number of over 1,000 assembled in Johnson's grove near Gonzales, Sunday, June 6, as the guests of the dairymen's department of the Monterey County farm bureau.

A very interesting program had been arranged and it was carried off without a hitch. Jolly parties of dairymen and their families began to assemble at ten o'clock, and after an hour of general conversation and visiting the program was started with a cow judging demonstration given by Professor V. C. Bryant of the college of agriculture. Two cows were provided for this number and Professor Bryant explained the desirable points of a good dairy cow in a most convincing manner. His talk aroused a great deal of interest and many questions were asked and answered. Mr. Thomas Mayhew followed Professor Bryant with a talk upon the farm adviser's work. He carefully explained that his office was one of service and that dairymen were privileged to call upon him at any and all times for assistance in solving their problems and developing the dairy industry.

At the close of Mr. Mayhew's address the welcome call to dinner was given. "Butch" Beever and his assistants had been working for hours over the pits and the beef was done to a turn. Two hours were required to do full justice to the splendid feed which had been provided. After everyone had eaten and drunk his fill, the balance of the program was carried out. Mr. Inglebritson of the research department of the Sperry Flour Company gave a highly interesting talk on cow testing and feeding. He was followed by Mr. Crate, who gave a convincing explanation of the modern milking machine. Mr. Crate predicted that within a very short time the mechanical milker would supplant hand work in all herds of ten cows or more.

Sam H. Greene, secretary of California Dairy Council, and Mr. P. Zabala addressed the gathering and talked about general dairying conditions. Mr. Greene predicted that the Salinas Valley would in time come to be the second greatest dairying section in the state. Mr. Zabala complimented the dairymen for their progressive and cooperative spirit and urged that the picnic be made an annual affair.

One of the most interesting features of the day, and one that aroused great enthusiasm, was the auction sale of the bull calf, Creamcup Council Leader, for the benefit of California Dairy Council. The animal was donated to the council by Miss M. M. Holdridge of San Jose, one of the prominent California Holstein-Friesian breeders. Creamcup Council Leader is a son of Creamcup Anna Segis Beets and is by Creamcup Victor Tula Lad. His breeding is excellent, his dam having a record of 64 pounds of milk with her first calf. The granddam's record was 25 pounds of butter in seven days. "Butch" Beevers was the auctioneer and he proved his ability, running the bidding up to $725, at which price the animal was finally knocked down to Joseph Reichmouth of the P. & M. Ranch near Gonzales. Creamcup Council Leader was only four days' old at the date of the sale. He is a beautiful calf and gives promise of developing into a fine individual. This is the second instance of the interest taken by breeders of pure bred stock in California Dairy Council. The first was when Dairy Council Chief was sold for $400 at the dairymens' picnic on the Laguna Ranch of the Los Angeles Creamery Company last April. Dairy Council Chief was presented by G. M. Brown of the Burr Farms. The fashion set by Mr. Brown and Miss Holdridge will undoubtedly be followed by many others breeders.

The chairman of the day was Louis Viddoroni. The following gentlemen acted as the committee of arrangements: H. Rianda, Thos. Mayhew, P. Reinhold, A. Reinhold, J. Pearson, Frank Pura and J. C. Meyenberg.

SHORTHORN PRIZES

The American Shorthorn Breeders' Association invites the attention of all Shorthorn breeders to the very large amount offered for cash Shorthorn prizes for the current year. One hundred and fifty thousand dollars has been appropriated by the Shorthorn Association and in addition to that the various fair and show appropriations make a total around $300,000 for Shorthorns. Certainly this generous amount—far in excess of any prize appropriation ever offered before, by any breed organization—should encourage Shorthorn owners to prepare for the show contests. There is a greater advantage, too, in the prestige one gains by showing a few creditable representatives of the herd. It creates business. The inducements are calculated to stimulate Shorthorn activity on a still broader scale.

The largest single shipment of stock hogs ever sent off the Kansas City market and said to be the largest off any market in the world, was sent from Kansas City, May 21. The shipment consisted of 2,200 pigs averaging 92 pounds each. A special train carried the shipment. The animals were vaccinated by the double treatment, were loaded in clean and disinfected cars, and were fed and watered in transit without unloading. A feeding company at Jersey City placed the order with a Kansas City serum company and will feed the pigs on garbage, finishing them on grain.

MAKING THE DAIRY PAY BIGGER PROFITS

About eighty-four billion pounds of milk are produced in the United States each year.

Of this total the butter industry consumes approximately thirty-four billion pounds.

But—approximately thirty billion pounds of the amount devoted to butter-making becomes skimmed milk—having practically no market as human food.

IF someone should come to you and say—"I have discovered a new way to convert your corn-husks into paper-pulp, or—"I can make a new fabric from your wheat-straw," or—"I have found a commercial use for the chaff from your wheat," you then would suddenly realize the value of new markets.

In such manner Hebe comes to you and says, "I have created a new and more profitable market for your by-product, skimmed milk. I have done this by restoring to the skimmed milk a fat content—the element it lacks to make it more desirable, and therefore more readily salable as human food, for certain purposes. This I have accomplished by scientifically emulsifying the fat pressed from the pure white meat of the cocoanut with the skimmed milk, creating a product that serves in the home as an auxiliary to the daily milk supply in cooking and for baking."

The utilization of by-products is a big problem in every industry. Gluten, coal-tar, gasoline and cotton-seed were valueless by-products until someone found a commercial use for them. Skimmed milk is the big by-product of the dairies—thirty billion pounds of it are produced yearly.

The greater part of this by-product, which science tells us is a highly nutritious food, is being fed to stock, when according to the Department of Agriculture it could be used to better and more profitable advantage as human food. Hebe points the way to marketing skimmed milk as human food. It is the first big effort in this direction.

You will ask the question—How is Hebe to benefit the dairy farmer who is not near enough to a Hebe condensery to sell his milk there?

Remember, the Hebe industry is only in its infancy. It will grow with every can sold. Every bit of advertising put out by The Hebe Company will exert a beneficial influence on the dairy product market as a whole. Witness the influence on the market by the sale of nearly four billion pounds each year to the ice-cream manufacturers. While not every farmer is within shipping distance of an ice-cream factory, yet every milk-producer benefits by the demand.

There is no camouflage about Hebe. It is produced, labeled, advertised and marketed for just what it is—"A Compound of Evaporated Skimmed Milk and Vegetable Fat," for cooking purposes. It is not a substitute; it is not an imitation. It is Hebe and nothing else. Hebe creates a distinct place of its own, separate from the general class of dairy products. In seeking and finding its proper place in the market, Hebe will prove a substantial benefit to the entire dairying industry, increasing the general use of dairy products.

You will be interested in our booklet, "The Missing Third." Ask us to send you a copy. There is no charge for this. Address 2673 Consumers Building, Chicago.

Facts in BLACK & WHITE

Paid in Milk For Purebred Holsteins

The Reveille, Bellingham, Wash., reports that the Pacific Condensary Co., sells high-grade Holsteins to the ranchers at cost, taking payment in milk.

The company needs more milk and by introducing Holsteins expects to make dairying a profitable industry, thus increasing the acreage in dairy farms as well as the milk output per average cow. Just another instance of the standing of Holsteins among business men.

Shropshire Sheep
August 11, Butte City Ranch.

Shorthorns
August 11, Butte City Ranch.

Berkshires
August 11, Butte City Ranch.

All previous records were recently broken when the Winsor Ranch, Bonita, sold the senior yearling Duroc boar Great Sensation 3rd to Walter Dupee, Santee, for $8,000, making him the highest priced boar of any breed produced on the Pacific Coast.

Winsor Ranch retains the use of the boar until September, as they are featuring him in their coming sow sale. A large number of the sows included in the sale will be carrying his service.

Walter Gatton, who for the past year and a half has been in active charge of the Diamond Bar Ranch herd of Duroc-Jerseys, has resigned his position and is contemplating engaging in the livestock business for himself. Gatton has been identified with the livestock industry of California for a number of years and on two occasions has served as judge at the California state fair.

W. F. Sandercock, Berkshire breeder of Sacramento, reports the following recent sales: To Bruce T. Shute, Sacramento, the yearling boar His Royal Highness. This boar was sired by the Butte City Ranch boar Onward, and is a representative of the Epochal strain. Miller and Lux selected four boars; two are sons of Baron Duke 201st, grand champion at the 1917 National Swine Show, and two are by Rincon's Rival and out of a litter mate to Riverby Princess.

In a recent letter from W. S. Guilford of the Butte City Ranch he says: "We will hold our big annual sale Wednesday, August 11th, at the ranch. The offering this year will consist of about 60 head of registered Shorthorn cattle from the Butte City Ranch and the Golden West Stock Farm of O. L. Raper, and the following stock from Butte City Ranch: Over 100 head of registered Shropshire sheep, 40 head of registered Berkshires and 20 or more head of Shetland ponies. We do not expect this stock to bring record prices, but it is by far the best offering we have ever made, and we know those who buy this stock will make money on it and be satisfied with it. We are proud of the fact that stock bought at the Butte City Ranch is giving universal satisfaction. The sale will be conducted by the California Breeders Sales and Pedigree Company, C. L. Hughes, manager, and the auctioneers will be Colonel Ben A. Rhoades and George Bell."

R. L. McCollum, assistant farm adviser, has organized a Holstein calf club in Stanislaus County with an initial membership of 16. The calves were secured from Bridgford Company, Patterson; A. M. Bibens, H. E. Cornwell, R. L. Holmes, E. M. Morrow, all of Modesto, and E. Peterposten of Hughson.

The Millbrae Dairy, Millbrae, reports the sale of two young Holstein heifers and four young bulls to a Japanese buyer.

In addition to the report of the National Holstein sale in our issue of last week, the following details have been received: Miss Aralia De Kol Aaggie, a seven months old daughter of Sir Aaggie De Kol Mead and out of the 34 pound three year old, Aralia De Kol Pontiac Mead, dam of the $11,000 bull Sir Aaggie Mead De Kol, was sold by A. W. Morris and Sons, Woodland, to W. J. Higdon of Tulare for $3,300. Miss Aralia De Kol Mead, a six months old daughter of Sir Aaggie De Kol Mead and out of the 859 pound junior two year old Aralia De Kol Mead 2d, was purchased by Brentwood Farms, Philadelphia, for the very moderate price of $1,700. It will be remembered that Brentwood Farms paid $11,200 for Tilly Alcartra 2d at the National sale last year.

In the consignment of Bridgford Company, Patterson, the 18 months old son of King Segis Alcartra Prilly, King Prilly Segis Pontiac, was sold to F. B. Green, Evansville, Wisconsin, for the low price of $1,000. Boweda Alcartra Prilly, a daughter of King Segis Alcartra Prilly and 37 pound Boweda, went to M. E. Gutches, Long Prairie, Wisconsin, at $1,900. Rosa De Kol Alcartra Abbekerk, daughter of King Segis Alcartra Abbekerk and the 30 pound four year old Rose De Kol Cande, fell to the $1,600 bid of R. E. McLaughlin and F. O. Flygue of Minnesota.

One of the biggest disappointments in the California consignment was Roma Princess Alcartra, a 30.39 pound daughter of Prince Alcartra Korndyke, consigned by J. S. Gibson Company, Williams, and purchased by F. H. Boyle of Fond Du Lac, Wisconsin, for the bargain price of $1,300. It is known that the Gibson Company was offered almost twice that amount for her before she left this state.

All in all, the California breeders were generally well pleased at the reception that their offering received at the hands of the Eastern buyers.

California breeders will be interested to learn that the well known Rancho del Prado in the Santa Inez Valley, formerly owned by Judge Robert C. Canfield, has been purchased by Captain Harry Gantz and Mrs. Gantz, owners of the Helena Orchards, Fullerton. The new owners announce that in the future the ranch will be known as the "H. G. Ranch," and that their plans contemplate installing a herd of Herefords and Hampshire swine. At present a considerable herd of Ayrshires is on the ranch. Polo ponies are also being bred.

The July sale of bred Duroc sows by the Winsor Ranch, Bonita, promises to be one of the most important events of its kind ever held on the Coast. The offering, sired by such boars as Pathfinder, Great Orion Sensation, Orion Sensation, Orion Fancy King, and Great Model, is one of outstanding excellence. The sows are mostly spring yearlings and are a very uniform lot.

They are bred to the $8,000 Great Sensation 3rd, the highest priced boar on the Pacific Coast, and Winsor Giant Orion, the largest Orion Cherry King boar in the world.

Joe A. Haaga, field secretary for the National Duroc Association, wires Manager C. R. Thomas that twenty herd nominations have been received for the Los Angeles Livestock Show futurity, embracing both fall and spring litters. Mr. Thomas reports approval by the board of classified premium list, covering all livestock entries, and the same now is in hands of the printer. A total of $642 is hung up for pig clubs. A judging contest for boys and girls belonging to pig clubs is now in contemplation.

J. L. Dunlap is the Iowa man, now at Pomona, with fine specimens of big type Polands of Jumbo and Big Bob strains to show all who visit the ranch.

W. S. Morton at Gardena is known as a stickler for high class Hampshires. Morton has sold his entire crop of spring pigs. He raises two litters per sow each year without skip or break.

Dr. Burton C. Platt of Eagle Rock owns excellent foundation stock in big type Poland Chinas, and is also remembered as the man who conducted a successful public sale of registered Toggenburg and Saanen goats at the Liberty Fair.

A Berkshire herd that is destined to help make the Berkshire hog more popular in Southern California is the Santa Catalina Ranch herd, owned by D. J. Bastanchury, La Habra. The herd is under the management of E. N. Whittemore and is being rapidly developed along practical lines and is

headed by Kintyres Laird Jr., champion at the Panama Pacific Exposition in 1915. Royal Longfellow and Baron Premier are outstanding yearlings recently purchased from the N. H. Gentry herd at Sedalia, Missouri. This young boar and three litter sisters will be with the show herd this season and will cause considerable trouble for their competitors.

Five carloads of Salt River Valley milk cows have recently been purchased to go into the northern part of Arizona. Dairying is becoming an important industry in the new section opened up by the Apache railroad which runs out from Holbrook. Dairymen there plan to ship cream to Phoenix.

The Big Davie Ranch at Marinette, Arizona, has been sold to the Southwest Cotton Company and will be added to their Litchfield plantation. This ranch comprises 7,500 acres and brought $600,000 in cash.

The Italian Vineyard Company, Guasti, is developing a herd of Berkshires second to none, due chiefly to the efforts of Superintendent Alex M. Wilson. Mr. Wilson is sparing neither time, energy or expense, and is certainly picking the good ones. The herd is rich in the leading bloodlines of the breed, and while popular breeding will not be overlooked, still Mr. Wilson will devote much time and effort to putting Berkshires on every farm, as he realizes the small farmer is the backbone of the swine industry. To this end he is fitting a carload of barrows to show this year and keeping his herd matrons at work. However, it is a safe bet that should he decide to show a few of his herd sows he would be there at the time the ribbons were tied.

Jane Garden Farm, Sacramento, reports the recent sale of a year old Holstein bull sired by Sir Aaggie De Kol Acme and out of Maude Cordova Clothilde, an 18.19 pound three year old daughter of Prince Gelsche Walker, to E. B. Connolly of Willows. The second dam of this youngster is Maude Mooie Clothilde that has four A. R. O. daughters. Mr. Connolly is a new recruit to the Holstein ranks and it is his intention to assemble a collection of Holsteins that will take a prominent ranking in this state. Jane Garden Farm has also sold a young bull to Oswald Scrieber of Marysville. This calf is sired by King Sadie Vale Elzevere and is out of Montezuma Bettie De Kol that is a sister in blood to the well-known cow, Ontario Blonde Pietje, with a 33.07 pound record.

The first week in June witnessed great activity in pure bred livestock affairs. Beside the record breaking sale of Holsteins held at St. Paul, Carpenter and Ross sold 232 head of Shorthorn bulls and females, $1,436. In the sale the bull calf, Maxwalton Rodney was sold to a Mississippi buyer for $14,000. On June 4, O. Harris and Sons of Missouri, sold 98 head head of Hereford bulls and females for an average of $1,237. Repeater 182nd, a junior yearling, sold for $12,600. While the Holsteins were breaking records in the West and the beef cattle holding the stage in the corn belt, the Jerseys were hitting the high places in the East. At five auctions 365 Jerseys sold for a total of $470,240. At Linden Grove sale 84 head averaged $924. The Edmund Butler sale distributed 60 head for an average of $3,104. In this sale Gypsy Gamboge Lad, a two year old son of Sybil's Gamboge, sold for $23,000. The following day W. R. Spann and Sons of New Jersey, sold 79 head for an average of $1,359.

A meeting of the board of directors of the Southwest Berkshire Congress was held at the office of the Italian Vineyards, Guasti, June 9, at which time it was decided to hold a public sale of Berkshires at the ranch of D. J. Bastanchury, La Habra, Saturday, August 14. The sale will consist of 30 bred sows and gilts, bred to the good boars now maintained on the various breeders' farms. No animal will be entered in the sale that is not a good representative of the breed, and some of the most popular blood lines of the breed will be found in the offering. A barbecue dinner will be served. It would probably be hard to find a more suitable location for a sale, as pens for the animals are large shade trees that will provide comfort for all. The demand for good already provided and there are many Berkshires in the southern part of the state is increasing so rapidly that it was deemed wise to hold a sale in August as well as the one previously announced in October, during the livestock show at Los Angeles. Recent additions to the Berkshire herd of D. J. Bastanchury, La Habra, include Lad's Champion Lady, Superior Duchess 6th, and Real Type's Lucindy 2nd. All of these were secured at the recent sale of E. J. Barker Thorntown, Indiana, the purchase price for Real Type's Lucindy 2nd being $1,000. This gilt was shown as a senior pig and either won or defeated the winner at the state fairs of Ohio, Indiana, Kentucky, Missouri, Iowa, Tennessee, Nebraska, New York, Minnesota, Wisconsin, Michigan, Kansas, Oklahoma, Memphis Tri-State Show and Eastern Berkshire Congress. She farrowed a late fall litter, two of which were in the sale averaging, as pigs, better than $200. As a senior yearling she will probably rank with any to be found in the state. She is exceedingly large, stands high off the ground on good feet, has an extremely well arched back and is very smooth. The Bastanchury herd will be seen at all the prominent fall shows.

SUPERSTITION

By A. L. Spellmeyer

The present status of values for sheep in the range country is $20 for a 125 pound ewe and $50 for a 1,000 pound cow. You can't figure breeding stock by the pound, but if you could the ewe would be worth something over 16 cents and the cow six cents. Figuring the offspring, the lamb ordinarily would bring 14 cents and weigh 70 pounds and the yearling steer eight cents and weigh 500 pounds, on a "catch as catch can" rough range basis. To the consumer the price of rib roast or leg of lamb is about the same, with a probable ten per cent higher price in favor of the lamb. The light wool of the Southwest shears about eight pounds to the sheep and has been bringing from 60 cents to 75 cents per pound.

Cowmen and sheep men never do get along very well, as a deep and abiding prejudice against sheep, the smell of them or the taste of mutton, lingers with many old range men, in many instances to their financial detriment, as the woolly range gleaners are money makers and have a twice yearly turnover, in wool in the very early spring and in lambs in the summer and fall. Sheep on the same range as cattle often bring excellent results if handled properly, but under the same owner there is no comradeship among the men who handle the two kinds of stock. Like oil and water they mix under compulsion. In the marketing and packer turmoil the sheep men are pro- and the cowmen anti-.

Shedding whatever intelligence one may have inherited or acquired, and proceeding upon the uncharted sea of the "sixth sense," fourth dimension, or vague instinct, most cow punchers figure when sheep are up cattle will be down, and when cattle are up sheep will be down. Irrespective of any known cause this seems to have worked out as far back as most of us can remember. For several years the sheep business has been very profitable wherever the seasons have been favorable, and during those several years cattle have been on low price levels in comparison.

Recently lambs and sheep have been hit with a lower price, and if the old idea works out cattle are due for an advance.

Ten times as much rice is being exported from the United States at the present time as in 1914, and rice growers are receiving 30 times as much money for it. Exports of rice in the ten months ending October 31, 1919, the last available figures, aggregated 28,000,000 pounds, as compared with 26,420,009 pounds in ten months period ended with October, 1913. The value of rice exported during the ten months period ending with October, 1919, is stated by the government at $25,182,000, against $883,000 as the value of the rice exported during a corresponding period in 1913.

King's Big Bone Leader

Assisted by Giant Bob 2nd, a son of last year's champion, is siring a high grade of Poland Chinas. Remember my big August sale of bred sows featuring the above boars.

Les McCracken **Ripon, Cal.**

Trewhitt's Big Type Polands

have been developed by a most careful selection of individual excellence and blood lines that have made good in Poland China history. Size and feeding ability have always been essential features demanded. Let your next purchase be a Trewhitt-bred Poland.

W. D. Trewhitt **Hanford, Cal.**

When Writing Advertisers Mention California Cultivator

Berkshire Sale by Inglewood Pig Club

The sale of Berkshires by the members of the Inglewood union high school was held on the school farm, June 4. Twenty-four pure bred Berkshires were sold, the greater part of which were pigs of spring farrow. Zinn. A number of the members showed extraordinary ability in feeding and developing, as a number of early spring pigs were sold weighing around 125 pounds, or nearly a pound a day gain from the time of farrowing.

Knocking Down Husky Young Berkshire

Auctioneer Rhoades and Berkshire Booster Bennett with husky boar pig on the block, "going, going, $37.50."

Seven gilts just old enough for breeding were sold for an average of nearly $85, while the pigs sold for from $20 to $45, according to their age and development. The club was formed late last fall when about 20 Berkshire gilts were purchased, and the work has been carried on under the instructions of the school agriculture teacher, C. S.

The sale was held on the school farm and as a result Berkshires are now being raised on a number of nearby farms where heretofore no swine had been kept. Col. Ben A. Rhoades of Los Angeles donated his services as auctioneer and the satisfactory prices realized were due, in a great measure, to his untiring efforts.

First Annual Ram Sale

The first annual ram sale to be held under the auspices of the California Wool Growers Association will take place at the state university farm, Davis, on June 24 and 25, 1920. Although this represents the first attempt made in California to hold such a sale, present indications are that it will prove a great success. Three hundred and twenty-two stud rams, range rams and registered ewes will be sold at auction, with Col. Ben A. Rhoades of Los Angeles wielding the hammer.

The sheep consigned to the sale are being inspected by officers of the Wool Growers Association and all sheep not considered first class individuals have been barred from the sale.

On the night of June 24 a moving picture show has been arranged. A five-reel feature entitled "From Wool to Cloth" will show in detail every step which wool undergoes from the time it leaves the sheep's back until it is ready to be worn by the consumer.

A wool exhibit has also been planned and attendants at the sale will be able to study and handle fleeces from some of the best show sheep that California produces.

A list of the consignors to the sale follows:

Rambouillet: Carl Lindenheimer, Woodland, 10 range rams; A. S. Mann, Ukiah, 20 range rams; university farm, Davis, 1 stud ram, 8 range rams; G. N. Merritt & Sons, Woodland, 18 range rams; Bullard Bros., Woodland, 12 range rams, 5 stud rams, 10 ewes, 19 range rams; Dalhy Bros., Dixon, 5 range rams; Chas. A. Kimble, Hanford, 20 range rams.

Hampshire: Spencer Ranch Co., Cranmore, 2 range rams; Kaupke Bros, Woodland, 10 ram lambs (Reg.), 5 ewes; university farm, Davis, 1 stud ram; Calla Grove Farm, Manteca, 25 range rams (Reg.), 5 stud rams, 50 ewes; Wm. Bond, Newark, 1 stud ram (Imp.); C. Harold Hopkins, 5 stud rams, 5 range rams (Reg.).

Shropshire: J. C. Montgomery, Davis, 2 stud rams, 5 range rams; J. W. Marshall, Dixon, 5 stud rams; G. K. Swingle, Davis, 1 stud ram, 5 range rams; Frank Campbell, Davis, 4 range lambs; university farm, Davis, 1 stud ram; Butte City Ranch, Butte City, 5 stud rams; Benj. B. Shaw, Hollister, 1 Reg. ram lamb (Imp.); Oeste Bros., Davis, 5 stud rams; Harry L. Huston, Winters, 5 stud rams.

Corriedale: Benj. B. Shaw, Hollister, 2 Reg. ram lambs (Imp.); Ellenwood & Ramsey, Red Bluff, 20 range rams.

Romney: University farm, Davis, 1 stud ram; Spencer Ranch Co., Cranmore, 1 stud ram.

Southdown: University farm, Davis, 1 stud ram; Benj. B. Shaw, Hollister, 1 Reg. ram lamb (Imp.).

Cross breds: Spencer Ranch Co., Cranmore, 12 range rams; I. A. Burrows, Newville, 20 range rams.

Cactus as Silage

Doubtless many Cultivator readers know what a pest the American prickly pear cactus has become in Australia, by far the worst weed pest that country has ever had. The government has combatted it in every way possible, as have the landowners both individually and collectively. Having it with them in such large quantities, they have sought to make some practical use of it. Yet it was from the United States the first help came.

Ranchers in Arizona and elsewhere had various methods and equipment for singeing the spines so they would not stick in mouth or throat, for once in the stomach the spines soon lose their rigidity. According to a department of agriculture bulletin (No. 74), published in 1905, a rancher in Colorado had some success in feeding steamed prickly pear. He had found that spines wet for a considerable time became soft, so he fitted up a tank and boiler to hold three tons of cactus, steamed for several hours and fed it mixed with other foods, with considerable profit.

But we have received no reports of cactus being used for silage, and should it be proved a success in that direction there is an enormous native supply growing wild in many parts of the Southwest. An Australian dairyman has found that spines soon become innocuous in the silo. In the Agricultural Gazette of Victoria he says: "In my article in Gazette of April last I mentioned that I had included 20 loads of prickly pears in a stack of ensilage with maize and sorghum. I now have the pleasure of forwarding you a sample and reporting unqualified success. The cattle like the pears quite as well as the other constituents of the ensilage, and prefer these pears to the steamed pears, which I am still giving them. I estimate that the pears amount to one-third of the whole stack. In building the stack I put alternate layers of pears and maize and sorghum, four loads of pears in one layer, but never allowing the pears to be nearer than a foot to the edge.

"At present I am feeding the cow-

on this ensilage, steamed pears, and barley, all on the same day. There is also a good picking of green herbage, yet everything is eaten up clean. The milk test is at present four per cent of butterfat, which is amongst the highest at my creamery. Now, as this ration has a good proportion of prickly pear, tho facts stated prove that there is considerable virtue in the much despised prickly pear. It only remains for me to add that the pears were placed in the stack whole, including thorns and roots, the largest bunches being afterwards chopped to flatten them. The heat and ferment of the silo has softened the thorns and rendered them harmless. I always add a bag or more of coarse salt to a stack to make the fodder more palatable."

DO NOT OVERFEED SKIM MILK CALF

"Overfeeding," says C. H. Eckles, chief of the dairy husbandry division of the Minnesota college of agriculture, "is probably the most common cause of lack of success in raising calves. It is a mistake to assume that because the cream has been removed the calf needs more milk or that because the calf is not doing well it is not getting enough milk and should be allowed to gorge itself. A good rule is always to keep the calf a little hungry. Some provision must be made for making certain that each animal gets its share and no more. A satisfactory plan is to tie the calves in small stanchions during the feeding. Each calf then gets its proper amount and cannot interfere with the feeding of others.

"Under natural conditions the calf takes its milk frequently and in small quantities. When fed by hand two feedings a day is the general practice and special care must be taken not to allow the calf to consume more milk than it can digest. For the first two weeks ten to 12 pounds a day is all that the largest calf should receive. If it can be done without too much inconvenience, the calf at this age should be fed three times rather than twice daily.

"As the calf grows older, twice a day feedings are sufficient and the milk may be increased, but at no time is it necessary to feed more than 16 or 19 pounds daily. By the time the calf needs more than this amount, it will take the additional feed necessary in the form of grain."

SEASONABLE HINT ON COOLING MILK

With the advent of warm weather some of the milk of the home dairy is likely to become sour unless steps are taken to keep it properly cooled. In this connection, Harold Macy, dairy bacteriologist at the Minnesota university farm, says:

"In order to insure the best quality of milk for delivery, it should be cooled to 50 degrees Fahrenheit or below as soon as possible after milking and kept at that point until it is delivered. To do this it is necessary to depend upon some other means of cooling than air. If you have no cooler the best way to do is to place the can of milk in a tank of cold water and stir the milk at intervals until it reaches the temperature recommended.

"If plenty of cold running spring water or well water is available, there should be no difficulty. If you have ice you can make good use of it to lower the temperature of the water. A little care exercised each day in the cooling of the milk will check the return of sour milk so common later in the season."

AMERICAN JERSEY CATTLE CLUB ANNUAL MEETING

The fifty-second annual meeting of the American Jersey Cattle Club was held in New York on June 2. The total registrations and transfers of Jerseys for the year showed an increase of 25 per cent over the figures for the previous year. There are now more than 6,000 Jerseys on Register of Merit test, the testing being done by 775 Jersey breeders. Three new records were made in the past year, two of them being champions over all breeds, one in the senior yearling class and the other for cows of twelve years and over. The growth of the club's business is more clearly brought out by the fact that it has outgrown its present building, which was erected only a few years ago ,and that it has become necessary to purchase the adjoining building for additional office space.

There was discussion as to changing the methods of nominating and electing officers and directors. This matter was referred to the board of directors, who were authorized to work out a plan. Issa Tanimura, sent by the Japanese government as commissioner of livestock, was elected first honorary member of the A. J. C. C.

All of the officers were reelected. M. D. Munn, president; E. A. Darling, vice president and George T. Chaffee, treasurer; R. M. Gow, secretary.

Four new directors were also elected in place of the retiring members of the board. Senator Carter Glass of Virginia, former secretary of the Treasury, was elected to the board by a unanimous vote. Other distinguished breeders, the Hon. C. N. McArthur, congressman from Oregon; W. A. Griswold of Tennessee, and C. J. Tucker of Missouri, were elected directors.

FEED AND LIVESTOCK CONDITIONS

J. E. Rickards and E. E. Kaufman, field agents of the bureau of crop estimates of the U. S. department of agriculture, report the condition of pasture and the hay crop by counties, as of June 1, 1920, as follows:

County—	Alfalfa	Pasture	Hay	Alfalfa Acreage 1919
Zone 1				
Lassen	81	74	76	18,500
Modoc	82	80	86	18,000

Ventura	95	90	85	750

The alfalfa acreage figures by counties submitted herewith are those returned by the different county assessors to the state board of equalization for the year 1919. The estimated acreage of alfalfa by counties will indicate in a general way the relative importance of each county in the production of alfalfa hay, although in many counties more or less alfalfa is pastured all or part of the season.

Reports for the entire state indicate a very slight increase in the acreage of alfalfa compared with last year. The condition of alfalfa for the state is 89, the lowest since 1913, while the ten year average is 93.

Pasture is only 76 per cent of a normal, compared with 91 last year and a ten year average of 86. Pastures, it will be noted, are best in the southern and mountain counties where the rainfall was heaviest. Considerable pasture will doubtless be obtained from some grain fields which will neither make grain nor hay.

The condition of hay, which includes all kinds—alfalfa, clovers, timothy, wild and grains cut green—is placed at 81 per cent of a normal compared with 87 one year ago and a ten year average of 84.

Is Your Cream Check Insured?

Insure your cream check against slumps due to dry pasture and lack of green feed with an Indiana Silo. Green, succulent silage makes dairy cows improve in butterfat tests.

Indiana Guarantee

Because we know Indiana Silos from the standing timber to the finished product we back them to the limit. If used according to our instructions Indiana Silos will give satisfaction. If they do not we will replace them or refund your money. Our assets are more than $2,000,000.

Certain Green Feed

With an Indiana Silo *you* control your pasture—not the weather. Regular, green silage rations will increase that cream check. Indianas are built of No. 1 Fir. Airtight, self-draining, tongue and groove joints. Three men in three days can erect an Indiana. Write for our free book on silos.

is some boar. As an individual he ranks as one of the best in the state. His get are the type that experienced breeders demand. Let me fill your order for anything in the Duroc line. You will be pleased with your purchase.

H. C. WITHEROW **Live Oak, Sutter Co., Cal.**

Do Crows or Ravens Become Killers?

A report has been received from eye witnesses of an instance in Mendocino County where flocks of crows (not identified) had attacked and killed 15 newly born lambs, the property of L. J. Romer of Ukiah. In each case the newly dropped lamb had been attacked by the birds as soon as parturition occurred, the damage being restricted to the umbilical region exclusively and resulting in the death of the young lamb. On being disturbed the wary "crows" took flight before it was possible to identify them.

Now as a matter of fact such birds as ravens and crows are sufficiently well developed, both physically and mentally, to accomplish such damage to small animals at such a time, and possibly the death of many lambs attributed to predatory animals is in fact due first to crows that kill the lamb when first dropped, to be followed by a dog or coyote that frightens off the crows and devours the carcass at leisure.

Let us look, for example, to the early history of New Zealand. Before colonization set in the fauna of New Zealand numbered among other birds a fruit eating parrot, the "Kea" parrot. Later civilization brought livestock and sheep. Carcasses of sheep left hanging attracted flocks of Kea parrots that devoured the fat surrounding the kidneys. The parrots acquired a taste for flesh and today sheep raising in New Zealand has become a problem through the fact that these ravenous birds attack and kill living sheep in the field.

Where such damage occurs in California and it is not possible to get sufficiently close to identify the birds, one should carefully ascertain by direction of flight the location of the "roost," after which specimens of the offenders may be secured and identified. One fact would seem to point to the common crow in that the birds attacked the lambs in "flocks," whereas it is understood that the raven does not fly in numbers.

Farm Labor and High Cost of Living

By Wm. H. Overholtzer

The farm labor problem has reached a point where there must be something done. We cannot produce and harvest our crops with the shortage of labor; and worst of all, the class of labor that the farmer must put up with will drive many a good former to farm just what he can do himself. Why is it that the farmer must take this poor, inferior labor—simply because every other line of labor is paid more than the farmer can pay. The farmer should get such returns from his crop that he can pay the top wage, so he can get the best help available.

A year ago I tried a new plan—hired my regular help for a share of the crop—and it worked fairly satisfactorily till the time came when we needed extra help, and then we were up against it just as the wheat farmers of Kansas are today, where it is said 25 per cent of the wheat crop will be wasted because sufficient help cannot be obtained to harvest it.

I have a government report showing the shortage of farm labor. This report says some of the cotton in the South was not picked last year because of the shortage of help; and then goes on to show that conditions will be worse this coming season. What is becoming of all the help that we used to depend on to do the farm labor?

There is no other conclusion to come to but that the wages that have been paid in every other line of industry have been greater than the farmer could pay and have drawn the help from the farm; better pay and shorter hours in the cities leave no help on the farm except inferior help that no other line of industry wants.

The only solution to this farm labor problem is for the farmer to pay just as high wages as any other industry can pay; and the only way this can be done is by giving him more for his produce, or bringing down the high cost of living so wages will come down with it. My method would be to put many men out of employment that are now employed in useless occupations and place more men where they are needed on the farm, and pay them just as much as the best industries can pay them.

To accomplish this we must make laws to control the profit between the producer and the consumer. When we began shipping onions from the Coachella Valley the farmer received $2 per crate or four cents per pound. Freight to Los Angeles would not exceed 50 cents per crate, or one cent per pound, or a total delivered in Los Angeles of five cents per pound, and the retailer retails them for 12 cents, a profit of seven cents for the middlemen. Two cents ought to be enough, and the retailer should have that. And if we had a law not allowing a greater profit than the amount paid the producer, these onions would have been sold for nine cents retail instead of 12 cents. If we had such a law, all retailers would have to do would be to organize and have a buying agency to buy all produce for the retailers and distribute it to them at cost, and then the only profit there would need to be would be the retailers' profit, and the retailer can certainly handle the goods for half what the farmer can produce them for and prepare them for market, for the onions, crates, and preparing for market cost the farmer 75 cents per crate. What did the producer have for his profit when the last shipment sold for 85 cents f. o. b. cars, and many acres more not harvested? Can we not get action in some way—make laws to control the profits between the producer and the consumer?

A $10,500 Cow—and Worth the Money

Ruby Pietertje of Forest Hill 2nd, consigned by W. J. Higdon, Tulare, to the National sale at St. Paul and purchased by Wheatfield Farms, Wisconsin for $10,500. Ruby holds the Pacific Coast 30-day record, 162.5 pounds butter from 3,144.6 pounds milk. Her seven day record of 39.74 pounds butter was the largest record reported last year.

GOOD MANAGEMENT OF THE PUBLIC'S INTEREST

According to Jonathan S. Dodge, chairman of the board of supervisors, Los Angeles County is the owner of King Korndyke Pontiac Mead, a young bull 16 months old, that is a half brother of King Korndyke Pontiac Acme, just purchased at the Holstein sale at St. Paul by Mrs. Anita Baldwin for $41,000.

The dam of Pontiac Mead is de Kol of Valley Mead 2d, and his dam's dam is De Kol of Valley Mead. De Kol of Valley Mead was four times grand champion at the California state fair, and she has three daughters, all with seven day records above 24 pounds of butter, and all with yearly records above 700 pounds of butter. Her best daughter is De Kol of Valley Mead 2d, with a record of 1,011 pounds. De Kol of Valley Mead 2d is full sister to King Mead of Riverside, all of whose tested daughters average above four per cent on a yearly test.

The sire of King Korndyke Pontiac Mead was recently sold to the Crescent Creamery for $12,000, and his dam held three different worlds' records, and still holds on. When King Mead is four years old it is well to presume that the herd at the county farm, owned by Los Angeles County, will have at its head a bull that is unexcelled by the record of any in Southern California.

HORSE ASSOCIATION OF AMERICA

Wayne Dinsmore, secretary of the Horse Association of America, has announced the appointment of Hamilton Bassett of San Luis Obispo as Pacific Coast representative of that association.

Mr. Bassett is well known to California livestock men as the proprietor of the White Triangle Ranch, and his Clydesdale horses are well known throughout the state. He is a thoroughly practical horseman, has traveled all over the world, is thoroughly familiar with breeding, rearing, breaking and use of horses, and is a well known writer who has been contributing news notes to agricultural papers for many years.

Mr. Bassett will visit the larger cities on the Coast, will personally study transportation conditions found therein, and will give you from time to time news stories dealing with existing conditions. He will also visit the irrigated tracts and the large ranches and will cooperate in every possible way in bringing about a clearer understanding of the indispensable part which the horse and mule plays in agriculture and transportation.

TANNING LEATHER

Leo Mereno of Wilmington spends a bit of his spare time in making a high grade sole leather. He gives us the following facts regarding green hides and leather. The ordinary green hide weighs about 60 pounds, for which the farmer may receive anywhere around 18 cents. For his own work he requires selected hides so that he secures from dealer at a price around 30 cents. A 60 pound green hide reduces to about 20 pounds of cured sole leather. Nearly a month is required in curing the leather. Six days of this is in lime and perhaps 20 more in working, coloring and finishing. This hide ready for use by the cobbler is sold for $1.50 per pound. That is, if it is not cut. Cut pieces or selected pieces may command double that amount.

ATTENTION SHORTHORN BREEDERS

The American Shorthorn Breeders Association has received communications from the animal husbandry department of various colleges and universities in regard to young men who are desirous of working on the breeding farms during the vacation. It is a regular practice with a number of well known breeding firms to employ one or more of these capable young men, and with very satisfactory results. One Shorthorn firm engages ten each season. The wages are moderate and the young men being interested in learning the details of the business are very useful. Many such a young man has later become a fixture in the business with his first employer. Not a few have later formed partnerships with their employers. In view of the present limited labor force this is an opportunity that may well be taken advantage of by Shorthorn breeders. The sooner the matter is arranged the better. Applications may be made directly to any one or more of the institutions or through the American Shorthorn Breeders' Association.

AUSTRALIAN WHEAT CROP

The wheat crop has been disastrously affected by the drouth in New South Wales. It is estimated that the yield of the present season will be only 4,296,000 bushels, the smallest during the past 20 years. There is, in fact, an insufficient amount of wheat even for domestic consumption in Australia.

Humboldt County wool growers have combined and agreed to hold entire output for a 60 cent basis.

NEW IDEAS FROM DAVIS

(Continued from Page 975.)

llar swelling on the comb. Always it appeared in pullets or cockerels, never in old hens, and always, when it occurred in pullets there was the broken egg in the abdomen. In all these cases the disease was recognized by bacterial examination, and a thorough cleaning up and disinfecting usually eradicated it. Vaccine was tried without much success, but bichloride or mercury in the drinking water checked infection.

Mixed Feeds Best

Tests with several flocks to determine what scratch grain or mixture of scratch grain is best brought out the fact that a mixture is always better than one grain alone. If either corn or barley must be used alone, corn gives slightly better results than barley, but the mixture of the two is better than either alone. A flock fed barley alone laid 99 eggs, while another flock fed a mixture of corn and barley laid in the same time 108 eggs. One reason for keeping before the fowls a variety of grains is that the presence of an abundant supply of vitamines is thus assured. Nobody knows just what vitamines are, but we know they are contained in milk, fruit, greens, meat.

On the question of green feed Professor Dougherty is more emphatic than ever. He told of an epidemic last year among the flocks around Haywards which for a time could not be explained. Lack of green feed was suspected as its cause, because it was known that the poultrymen had been short of greens. Experiments with several flocks, one of which has been given no greens for a number of months, substantiate this suspicion. While the flocks that received greens remained healthy and productive, those without began to die off, and it looks as if not one would be left by the end of a year. "The man that can't raise green stuff had better not raise poultry. Green feed is the foundation of success." These words are quoted exactly because we cannot emphasize this point too much. Any piece of bare land is not "good enough for chickens." It must be fertile enough for all sorts of green crops and the water supply must be ample. The more irrigation the more succulence in the green, and succulence is what we want. Alfalfa hay and beet pulp are not green feed, but anything green, freshly cut, tender and succulent will answer.

Hatch Early

January and February are without doubt the best hatching months, Professor Lloyd declares, and charted data seemed to show that January is a little better than February This is because chicks do not grow as rapidly or as symmetrically in the dry, warm days of late spring as in the moist, cool winter weather. November and December pullets do very well but are not quite as profitable layers as the January pullets. California poultrymen will avoid loss and trouble by sticking to the "hatch early" rule.

For Coccidiosis

Remedies for coccidiosis which have proved quite efficient when sour milk was not available were suggested by Dr. Beach as follows:

Hydrochloric acid in the drinking water, 1 teaspoon to a quart of water. Must not be used in metal container.

Zinc sulphocarbolate, 1/1000 solution, or 1 pound a day to 1000 chicks in dry mash.

Thymol, 1/1000 solution, used 3 days at a time. This is the most expensive and least desirable.

Bismuth subnitrate. (I did not catch the dose.)

Coccidiosis, fowl cholera and intestinal worms are all most prevalent when the chicks or older birds are on contaminated ground. Probably it would be useless to say "Keep your chicks on clean ground," for brooder houses as well as laying houses are permanent and must be used where they are, but double yards with a crop grown in each yard in alternation are a great help in purifying the soil.

Keep Accounts

Mr. Eason appeared just for a moment, but long enough to say he believed the most important thing to urge on all poultrymen is the keeping of accounts. "Half of them," he declared, "don't know whether they are making money or losing it, and it is some job to get them to keep books consistently and persistently" If this is true, it is a challenge to everybody who keeps any chickens at all to at least know where he stands and what it is costing him to produce a dozen eggs.

NATIONAL EGG LAYING CONTEST

Mountain Grove, Missouri:

The 300 contest hens laid 6,121 eggs during May, or an average of 20.4 eggs per bird. Pen 16, S. C. White Leghorns, owned by Homer Collins, Ozark, Missouri, won the cup by laying 135 eggs during the month.

THE PERSONAL RIGHTS MAN

By J. P. Iverson

One of the most serious difficulties with which the inspector has to contend is the skeptical man, generally known as the "personal liberty" or "personal rights" individual. This sort of a man believes that certain personal liberties are the inalienable privilege of every American citizen and fails to look beyond and realize that every American citizen also has certain plain duties which he should, and must, perform. Generally he believes himself to be the crowd and is the kind of man who will dart off at a tangent from the great mass of public opinion and then call loudly, "Come on and follow the crowd!" He does not realize that he, personally, does not represent the crowd and further, that the principle of the American government is that all laws are based upon the desire of the majority and that, since that majority has spoken by laying down a law, it is incumbent upon the minority to abide by that law if they are to be considered respected citizens and not anarchists.

The personal rights man cannot see the justice or right of any law that interferes with his dollar chasing desire. He wonders what right any state inspector has to tell him that he must screen his milk house to keep the flies out of the milk or to ask him to go to the expense of installing a milk cooler or steam sterilizer to keep his bacterial count down. He has milked cows and drunk milk for years and never had any of this foolishness, and he is still alive! "If it is clean enough for me, why ain't it good enough for anybody?"

Another of these personal rights individuals cannot understand why his ranch should be quarantined when there occurs an outbreak of Texas fever, hog cholera, anthrax, or other communicable disease of animals. "Why shouldn't he be permitted to sell his animals—unload quickly, so to speak, even though by so doing he spreads the disease to his neighbors' herds? Let the other fellow worry!"

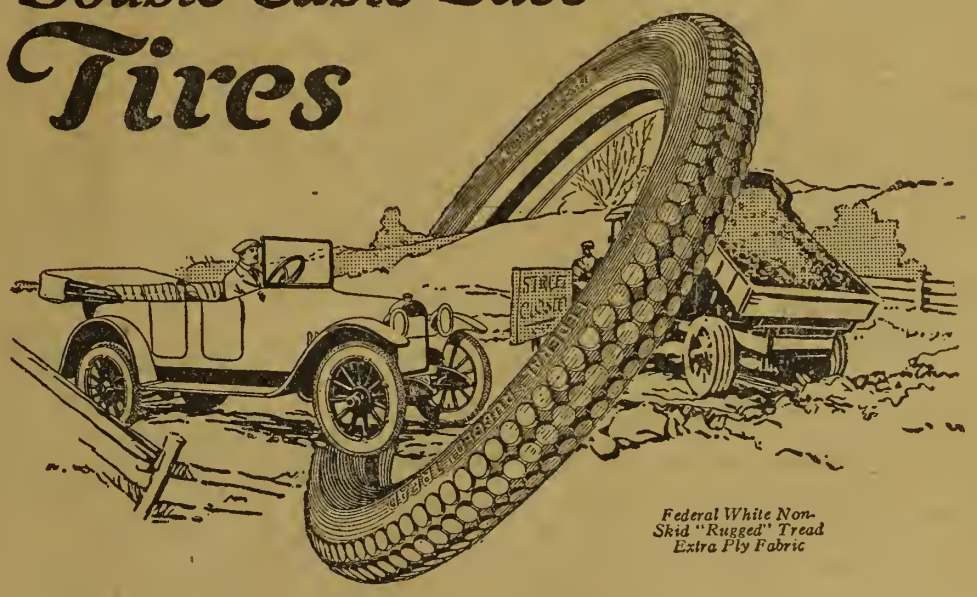
NO HIGH COST OF CLOTHING HERE

When a hole is worn in tapa cloth it is only necessary to moisten the edges and beat them together. Tapa cloth was once woven or pounded into shape in many parts of the South Sea Islands. It is made of barks of the banana, breadfruit or mulberry. The rough outer bark is first scraped off and the inner fibers are beaten together and allowed to ferment. So fine is the texture of the cloth that one would never imagine it had been prepared in this crude manner. It is bleached to a dazzling white color in the sun, and when made into garments is practically indestructible.—Boys' Life.

FEDERAL

Double Cable Base

Tires



Federal White Non-Skid "Rugged" Tread Extra Ply Fabric

The Strength of The Federal Union

Federal Tires are *united* with their wheels. Four enduring cables of stranded steel—the Federal Double-Cable-Base—grapple them to their rims inseparably.

This banishes the chief enemy of tires—rim wear.

Wheels cannot slip and grind within Federal Tires.

Thousands of Federal users are free from—tube-pinching; chafing and breaking of the fabric; rim-cuts and blow-outs just above the rim.

There is only one way to get this extra mileage—equip with Federals.

Poultry for the Tenderfoot

By Jean A. Koethen

TWO letters have come to me this week which open up a question the Californian must meet, and can meet only in a spirit of frankness and fairness. California as a state renowned for climate and wonderful natural beauty is also a state that is becoming known far and wide for the progress and stability of its poultry industry. It is no wonder people who love poultry and wish to boost the industry as well as gain a living from it should wish to come here. That is to be expected and desired. We want them, every one. The poultry associations want them. Real estate promoters want them. But we and they shall both be losers if we magnify possibilities or minimize difficulties.

The first letter is from an insurance man in Ohio. "I am writing you," he says, "for information on the possibilities of a poultry ranch in your state. I am contemplating coming to California to live this coming October and would like to engage in the poultry business. If you have any information for a newcomer I shall be glad to hear from you." He says nothing as to his capital, health or previous experience with chickens, but from the fact that the envelope bears the seal of the American Poultry Association I take it for granted he is a fancier with some experience in handling small flocks and wishes to go into the poultry business on a larger, perhaps on a commercial scale.

What shall we say to a man like this? First of all, I think, he must understand that the poultry business in California is in no essential different from the poultry business elsewhere, except that it is, if anything, a little harder here than in some parts of the country. Possibly I shall be criticized for that statement, and as all my poultry experience has been in California, I cannot pretend to compare with authority. I do know, however, that since California is not a grain country, as the Middle West is, feed inevitably costs more, and we cannot always afford the kind of feed that gives best results. Corn, as everybody knows, is one of the best all around poultry feeds. It is hard to raise young stock without it, hard to fatten broilers without it, and hard to keep laying hens in good condition the year round without it. Milo and the other sorghums take its place to some extent, and so does barley, but neither one is the dependable feed that Indian corn is. Ever since the beginning of the great war sent the price of wheat up we in California have had to skimp on corn. as well as on wheat. Its price has been around $5 a hundred so long that some of us have forgotten it never was a cheap feed, and we try to get along with the least possible amount of it.

Higher Prices Ahead

It has seemed as if there must soon be an end to such conditions, but those who are on the inside are looking for higher prices rather than lower, not only of corn, but of all other feeds. Only a few weeks ago J. T. Barber, president of the Poultry Produecrs of Central California, which handles the egg output of the Petaluma district, hung out storm signals, stating in the plainest language that the coming year promises to be a very hard one for poultry people, that it will cost close to $4 to feed a laying hen through the year, and that only men who are well established in the business can hope to break even. That is strong language, but it is Mr. Barber's, not mine.

In Southern California, while I have heard no prediction as gloomy as Mr. Barber's, I know there is a general feeling of uncertainty as to just what the coming year has in store for poultrymen. Eggs have not brought the prices they brought in 1918-1919, and went into cold storage at a considerably lower figure. With feed prices going up and egg prices coming down, we can hardly say to the tenderfoot, "Come right along in, boys. There's millions in it." A large poultry man who has been in the business near Los Angeles for 15 years said to me in January, "I get a lot of letters from eastern people who want to come here and go into the poultry business, and I don't know how to answer them. I don't like to discourage them, and yet I know most of the little fellows are producing eggs at a loss right now."

Of course, it may be something will happen to bring feed prices down, but as long as crop reports indicate a smaller area than usual planted to grain, we can hardly hope for much relief this year. The man who is well established and has the capital to buy feed where and when he can get it cheapest, who does not need to buy stock or build houses, can worry along and make a living. If he has a good hatching egg or baby chick business he can do better than that. It is the new man that will suffer most and soonest.

Personality Counts

Even if prospects were the best in the world I could hardly encourage the tenderfoot without knowing the kind of man he is. This seems trite, but it is not. The successful poultrymen I know are very hard working men. They visit the roosts night after night picking out the hens that do not come up to the mark. They study night and day to perfect their system, whatever it may be, for every successful man has his system. What they earn they earn by the sweat of their brows, every one of them. Only a man who can look forward without misgivings to "long days of labor and nights devoid of ease" need expect to succeed with commercial poultry keeping. Some men will succeed anywhere. You can't keep them down. High feed prices, long hours of labor don't scare them. Even such a one, however, must have capital and knowledge.

Slow and Easy Does It

My advice to Mr. S., and to every other tenderfoot is: Come to California. You can hardly make mistake. Whatever you do, you'll be glad you came. But, don't be in a hurry about making a living with poultry. Get a job in the city or one of the larger suburban towns. Buy a few acres, or a single acre, and plant it to fruit. There are thriving poultry communities within commuting distance of the larger cities where you can find a pleasant home and plenty of people to give you advice about starting with chickens. In January or February buy 100 day old White Leghorn chicks from a reliable hatchery and raise them. If you make a reasonable profit with the pullets you get from those chicks you will be ready to buy more chicks and raise more pullets. Meantime, stick to your job. Don't leave it till you can make a living with poultry.

Women in Poultry Work

The other letter is from a California woman who asks; "Can you give me any information concerning the poultry farms of the state that would permit me to encourage a young English girl to come out here. She is at present manager of the poultry department on an estate in England. She wants similar or suitable work on a poultry ranch in California."

I am afraid such a position as this girl is holding would be very hard to find in California. I know a good many poultrymen who keep help, but they all hire men to do the heavy and rough work on the ranch, while they themselves, or their wives and daughters, look after tending the incubators, raising chicks, and other light jobs. There must be wealthy people in this state who have country estates and hire some one to look after the poultry, but I do not know them. Perhaps they might be found by judicious advertising.

I do know, however, quite a number of women who are successful fanciers

and even commercial poultrywomen. One woman I have in mind cares for upwards of 1500 hens with the help of a young man and does a nice little hatching business on the side. Another, with the help of a boy, cares for 1,200 laying hens. Another, whose flock is less than 1,000 told me last winter, "I'm doing so well I hardly dare to think about it." These women all own their little ranches, and I hardly know how one would begin without capital enough to buy a little place she could call her own. If this young girl has a little capital to start with, or friends who can give her a home while she is getting her bearings, or some other occupation that she can follow while she is getting a start, and there is some one who will be interested in her where she is going, you can encourage her to come. I should be recreant to my own convictions, however, if I did not say emphatically, do not encourage any girl to make the trip from England if she must travel alone and be entirely among strangers after she reaches California. This has nothing to do with poultry. It is simple common sense.

Poultry Queries

Conducted by J. A. Koethen

Sea Grass

Will you kindly inform me whether sea grass would be good litter in a chicken house? It contains some salt. Would this be injurious?—Subscriber, Chula Vista.

A little salt in the mash is a good thing, but half a pound of salt to 100 pounds of mash is about the right proportion. Is your sea grass more salt than this? A little salt increases palatability, but too much is injurious and even fatal. It is said that over half an ounce will kill a healthy hen in from eight to 12 hours. I should not dare advise you without knowing just how much salt is in the grass. As you are near the beach, why not use sand instead of scratching litter? I have seen good clean beach and wash sand hauled considerable distances for this purpose.

Overcrowded

We have 200 chicks, from six weeks to three months old, and two-thirds of them have roup. They are in coops six by three, divided into three parts, and 35 chicks to each part. The coops are open front. Should curtains be let down at night?—B. O. W., Whittier.

What your chicks need is not less air, but more. They are sadly overcrowded. Twenty chicks to each of these two by three divisions is the utmost that should be crowded into them, and fewer would be better. Leave the fronts open but spread the chicks out. They are too warm all night, and when they go out into the morning fog they chill.

Roupy Breeders

If hens have roup will they pass it on to their offspring?—Subscriber, Whittier.

Most certainly they will—not the actual disease, but a tendency to it. A single attack of the disease might not affect the hen's constitution, but a hen that has roup every year should never be used as a breeder, and it is better to exclude her from the breeding pen entirely. There is too much roup in our flocks now. Let us do our best to eradicate it by never breeding from roupy stock.

Picking Geese

Will you kindly tell me in what months to pick my geese, and how? Also if picking will hinder laying.—Mrs. W. B. D., Vacaville.

Geese are picked in spring and fall, when the feathers begin to loosen, preparatory to dropping out. When you see your geese picking out their own feathers, then you may know it is time. At any other time it is cruel. Breeders should not be picked. Pick the young birds when you see them beginning to molt. I am not sure that this rule applies to all breeds, but it does apply to the Toulouse.

White Holland Turkeys

Some time ago a party advertised White Holland turkeys in the Cultivator. Can you give me the address, or that of some other breeder of gray or blue turkeys?—Mrs. F., Descanso.

White Holland breeders, where are you? No White Hollands were entered at the January show, but there must be a good many of them somewhere. By gray or blue I suppose you mean slate. They are scarce, but have been in the shows occasionally. Won't some breeder of these birds make his whereabouts known?

Summer Feeding

In January you gave me two mash formulas and I chose the following: 40 pounds bran; 20 pounds each of corn meal, middlings, barley meal and alfalfa meal; ten pounds each of fish meal and beef scrap; five pounds bone meal. I am feeding this warm morning and noon and at night give white Egyptian corn, rolled barley and a poor grade of oats. Have been steaming the barley and oats to make them more palatable, and have eliminated the corn altogether for the summer. After I put the pullets on the maintenance mash they stopped molting, but I notice they are beginning again. As it is extremely hot here, I should like to know if the above feeding is correct for summer. Later on I shall have sunflowers. In what proportion should they be fed ? Some of my pullets lay soft shelled eggs. Would you advise lime in the drinking water? Have been running a little water in the yard on hot days. Will it hurt the hens to drink from the puddles? Your former advice put my pullets in fine shape, and they have kept up a fine average for four months.—L. B., Arbuckle.

If it is as hot as you say (112 degrees in summer), you will need to feed carefully. Stop the warm mash and the steamed grain. Let them have the mash dry in hoppers or boxes before them all the time, and cut the meat in the mash down to 15 per cent. If you could feed some wheat with the barley at night that would be better than any kind of corn. The hens may not like rolled barley at first, but they soon get used to it. I think, though, whole barley sprouted would be better than rolled, in your climate. Soak it 24 hours, then pour in a box, cover and keep in the shade, sprinkling daily or oftener, till the white rootlets appear, then feed all the birds will eat at one meal. You might feed the sprouted barley in the morning, greens at noon, wheat at night, and the mash all day. Sunflower seed should not be more than ten per cent of the evening feed. It is better to feed a little at a time and make it last a good while than to feed heavily for a short time. For the soft shelled eggs give more oyster shell and, if you can get it, let the birds have granite or limestone rock to pick at. Feed all the greens you can, and do not try to force the pullets during the hot weather. It may be you have been feeding a little too large a proportion of grain, and the birds are fatter than they should be. If you follow the above suggestions you will not see many soft shelled eggs.

The moist mash is rather more fattening than the dry. That is one reason why it sours very quickly. Drinking from puddles will not hurt the hens as long as the water is reason-

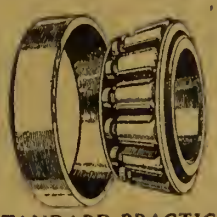
Do You Know—



STANDARD PRACTICE

The use of Timken Tapered Roller Bearings at points of hard service in the great majority of motor-vehicles is proof of leadership established on the tapered principle of design, quality of manufacture, performance on the road, and service to the automotive industry

that the motor car on your farm pays for itself in two ways—first, by the time it saves; and second, in the recreation it provides?

that Timken Tapered Roller Bearings make for easy *running* just as good springs make for easy *riding?*

that Timken Bearings show little wear even after long service, and can be easily taken up to compensate for that wear when it finally occurs?

that the tapered roller bearing—the Timken type—is *the* bearing that functions properly under radial load, or thrust load, and all combinations of the two?

POULTRY QUERIES

(Continued from Page 997.)

ably clean. You will need to use a good deal of water in your yards on hot days if you have not much shade. Sprinkle several times a day if the hens seem to feel the heat. Moist dirt, if it is not mud, is very comforting to them.

THE FORMAL DINNER TABLE

In setting the table, as in all other artistic performances, there are certain defined rules for procedure which should be observed.

A "silence" cloth should always be used under the table cloth to protect the surface of the table and to muffle the noise.

The table cloth should be laid smoothly and evenly on the table. If the table top is finely polished, doilies may be used instead of a table cloth for breakfast, luncheon or informal dinners. Twenty-five or 30 inches is allowed from plate to plate.

Lace doilies should be arranged on the service plates, and on these should be placed the cocktail glasses for fruit, oyster or other fish cocktails. The bread and butter plate should go to the left of the place plate, above the forks. On the right of this, with the blade turned in, the dessert knife should be placed, followed in the order mentioned by the meat knife (fish knife if used), soup spoon and oyster fork.

On the left, nearest the plate, is the dessert fork, followed by the salad fork, meat fork and fish fork. This rule can best be remembered by observing that the silver is laid in the order of its use from the outside toward the plate.

The napkin should be placed at the left of the silver, with the fold at the top, the open edges at the right toward the edge of the table.

The number of glasses used will be determined by the kind of beverage to be served. There are special glasses for nearly every kind of beverage. The water goblet is always essential. A tall stemmed glass is used for tarty beverages which may be served with the soup and fish courses. A low stem glass, usually patterned after the goblet, is used for any beverage which may be served with the entree and the roast courses. Any graceful arrangement of the glasses on the right at the head of the knives is proper.

An individual salt dish and spoon to the left, with an individual almond dish on the right, completes each place. Salt and pepper shakers may be used if desired. They should be so arranged that they will be conveniently accessible to all guests.

The Table Decoration

The arrangement of flowers is always one of personal taste. Complete color schemes and original decoration ideas are frequently fully carried out in flowers. The color scheme to be used is generally determined by the season, the flowers available and frequently by the event which has occasioned the dinner.

A very popular custom is to place a single flower in a slender vase at each plate. A low green center piece is very pleasing. A single rose laid beside each plate makes an effective decoration.

When Dinner Is Announced

The host, with his partner, leads the way to the dining room when dinner is announced. At the table, cards are placed at each cover showing the seating arrangement. Each gentleman draws out the lady's chair, waits until the host and ladies are seated and then seats himself.

Order of Seating

The guest of honor, if a man, should be seated at the right of the hostess; if a woman, at the right of the host.

The order of serving is very largely a matter of individual inclination.

All the women may be served before the men, beginning with the guest of honor or hostess.

Or the guest of honor or the hostess may be served first and then the next person, irrespective of whether man or woman, continuing thus around the table.

It is advisable to serve one course around the table to the right and the other around the table to the left, so that the courtesies may be equally divided.

Methods of Serving

There are three recognized methods of serving a meal—the English, the Russian, and the compromise. The Russian is more formal than the English and the compromise combines ideas from both.

English Service

In the English service all the food that is to be served in any given course is placed on the table in platters and other suitable dishes, before the host, hostess or some member of the family. The number of plates necessary for the persons seated is placed before the carver, or they may be taken one by one from a side table and set before him. As each plate receives its portion the waiter carries it either to the person serving another article of food, such as vegetables, or sets it directly before the person for whom it is intended.

When finger bowls are used a plate bearing a doily upon which the bowl is placed should be placed in front of each person.

Russian Service

In the Russian service serving is done from the serving table or pantry. With the exception of candies, nuts, and relishes, food is not placed on the table except as it is served to the individual. A portion of the main dish of the course and possibly one accessory are placed on each plate, before it is brought from the pantry. All other dishes are passed.

Sometimes the plates are all set down empty and the food is passed on daintily garnished platters. As the plates of one course are removed the plates of the next course should be immediately set in place. The table should at no time be without plates except that between the main course and dessert all dishes should be removed and the table crumbed.

Compromise Service

In the compromise service portions of courses are sometimes served on the table in the English way and others are passed as in the Russian service. The soup, for instance, may be brought in individual plates from the pantry and the meat carved at the table by the host, the vegetables and the salad course both passed by the maid and the dessert served at the table by the hostess.

The Courses

Oysters on the half shell may be served first, either on luncheon plates, surrounded by cracked ice, or on special oyster plates. It is a matter of preference as to whether this is done before or after the guests are seated.

If preferred, the first service may be a "fruit supreme," for which tall, flared, saucer shaped glasses with plates should be used.

The soup service follows. If the soup is served from the table it should be brought in by the servant in a tureen, with ladle, and placed before the hostess, whose duty it is to serve it. The soup plates are either rimmed or cup shaped. As each service is rendered the servant takes it from the hostess and passes it to the guests, always serving ladies first.

There the soup is served from the pantry the tureen is dispensed with, the servant bringing in the soup in individual services on a suitable serving tray.

Following the soup service comes the fish course. This requires a specially adapted service, including a long, narrow fish platter with sauce boat, ladle and fish plates, which should be slightly warmed. The fish platter is either passed from person to person or it may be passed by the servant and each guest is then expected to serve himself or herself. The sauce boat is not passed until the fish has been completely served.

The service plate may be removed before the roast course, although if removed it should be returned to the table after the roast course for the remaining courses of the dinner.

The meat course, which follows, if the English custom is employed, is brought in on a large silver covered platter or on a large china platter which may have a silver cover. The vegetables also may be brought in in appropriate covered dishes. The meat course is served on large, carefully heated dinner plates.

Where steak is served a heavy wooden steak plank, with silver railing, simplifies the service and is very effective.

With the meat course jello or jelly is frequently served. This is generally prepared in a special mold. These special molds may be had in original designs to carry out almost any desired decoration.

Vegetables may be served on the same plates, or passed in small, deep dishes.

The salad course comes next. It is served on small plates made especially for the purpose.

Appointments with the exception of the water glass and dessert knife and fork are now removed from each place and the table is crumbed.

The dessert service depends upon the dessert. If ice cream is served in individual molds or brick, flat plates are used; otherwise it is served in deep dishes or in tall stemmed glasses. An individual ice cream fork or ice cream spoon is used and may be placed on the table at the head of the service plate when the table is set, or it may be given with the course, at the time of ice cream service.

If the dessert consists of a frappe or similar delicacy it should be served in a comport or tall stemmed glass. If the heavier desserts, such as pie or pudding, dessert plates should be used.

According to the English custom it is perfectly permissible for pie to be served by the hostess at the table. In this event the pie plate is placed in a container with a silver railing.

Small plates containing crackers and cheese are now served, being placed conveniently at several places on the table. Then follows the after-dinner black coffee or demi-tasse. The coffee should be served from a china or silver coffee pot by the hostess and should be passed to each person by a servant.

Finger bowls of glass or metal, standing on a plate to match or otherwise, are now placed before each guest.

CLEANING PAINT OFF WINDOWS

Cleaning the windows of a new house or a newly painted house is no enjoyable job. The paint comes off easily, however, if given a little of the right kind of help.

One would hardly go to an automobile accessory store or a garage to find something with which to clean windows, yet it will be found that an ordinary tar remover, used by motorists to clean up their machines after a trip over newly tarred roads, is one of the best things obtainable for taking ordinary house paint off glass.

Here's another: The janitor who cares for the California Cultivator offices says the best thing is a safety razor.

JUST WAIT FOR THE THAW

Cheer up, chillun, tho the weather's mighty raw,
Every time dar comes a freeze, dar's gotter come a thaw.
It takes a little patience till de freezin'-time is done,
An' if you lose yoh temper, why, it doesn't help yoh none.

Cheerup, chillun, 'cause de weather's on de move.
When de luck appears de hardest, it is certain to improve.
Cold wave an' warm wave, dey gotter mind de law—
Every time you gits a freeze, you gotter have a thaw.

Cheer up, chillun, an' prepare to say "Hurrah!"
De chilliest proposition by an' by is boun' to thaw.
Yoh hopes dey keeps a droppin'—don't you let it make you frown,
Thermometers was built for movin' up, de same as down.

So, cheer up, chillun, 'cause you sho'ly might as well;
We all has our troubles, an' dar's nothin' new to tell.
Each botheration seems de worst you ever saw,
But every time you gits a freeze, you's gotter have a thaw.

—Washington Star.

CAPTAIN HAYDEN'S SUNDAY EXCURSION

(Continued from last week.)

This was the condition of affairs when the Captain came home one night in high good humor, bringing a diminutive white dog, the gift of a friend, which was to divide its time between the house and the yard, so he instructed Cynthia, but was never to be permitted on the street. Upon this small piece of dogship be bestowed the highly inappropriate name of Neptune.

The following Sunday morning Captain Hayden sat by the window awaiting his niece's summons to breakfast. He wanted to talk to Cynthia, to reprove her, and becoming impatient at the delay, his voice was irritable as he called:

"Cynthia! Cynthia! Now where is that girl?"

"Coming, Uncle," said a blythe voice. A door opened, and Cynthia, dark eyed, rosy cheeked, good to look upon, stood before him, smiling and unruffled at the imperative summons. It was never any trouble for Cynthia to smile, and her uncle's temperamental outbreaks were never taken very seriously by her.

"When I came up the street last night," the Captain began, "I saw that young puppy leaving this house. Now, girl, I've told you—"

"Impossible, Uncle," Cynthia interrupted demurely, a twinkle rising in her bright eyes. "The dog was shut in the yard and he is there now."

"By the Lord Harry, girl! Don't get smart with me," her uncle snapped. "You know very well who I mean. That young puppy, Barton. You're encouraging him in defiance of me. I've told you before and I tell you again, I'll not have him coming to my house. I'll not." And the angry old man raised the stick that aided in the navigation of his rheumatic leg, intending to emphasize his remarks with a vigorous thump on the floor, but by a slight miscalculation it descended with considerable force on top of his pet corn.

"Oh, Lord!" he groaned, "and it's all on account of that rascally Barton."

Cynthia fled, assuring herself that she would have to tell Fred to keep out of sight for an entire week.

His toe still throbbing, the Captain leaned back in his easy chair and glanced out the window.

"Eh! What the devil!" he exclaimed aloud. "There's Neptune," and seizing his stick, his slippers flip flopping at every step, he went out the door and down to the sidewalk.

This sudden activity on his part was caused by the sight of a small white fluffy dog meandering down the street, sniffing as he went, which the Captain quickly recognized as his property, even to the pink ribbon with which Cynthia had adorned him.

The Captain whistled. The dog stopped, looked back, wagged his tail and went on, with the Captain following. Half a block away the dog stopped again, glanced back at his pursuer and took another start. The Captain quickened his pace; so did the dog, then slowed down to hold converse with another dog, and the now distressed Captain came near enough to attempt a grab, when one of his slippers fell off. He limped back to get it, and the dog turned a corner and disappeared. Following as rapidly as circumstances would permit, the Captain collided with a fat lady, begged her pardon, received a glare in return, and finally rounding the corner caught sight of the dog standing motionless some distance down the street, waiting for him. Seeing the Captain he wagged his tail joyfully, as though to say "Come on. We're having a fine time, aren't we?"

The old gentleman was hot, tired and exasperated. The sun beat down upon his bald head; people on their way to church looked at him curiously. A number of small boys found the situation interesting, joined in the chase as spectators and began betting on the result, with odds in favor of the dog, but made no move to assist in his capture.

Suddenly an idea seemed to enter the dog's brain, and away he went, the Captain following, and the boys on his heels. The animal turned a corner rapidly, raced up a side street and into a court, where he stopped, turned and faced his pursuers.

At last! Thoroughly exhausted, the Captain made one grand effort and seized the offending animal, tucked it under one arm, and, leaning on his stick, took out a handkerchief to mop his perspiring brow, prior to turning his steps homeward, when a woman came out of a house and asked, in a very unfriendly tone, what he expected to do with her dog.

"Your dog, madam!" gasped the Captain. "He's my dog. He escaped from my yard."

"No such thing, sir. He's my dog."

"But, madam, I'm prepared to prove—"

"So am I, and I say he's mine. I'll have my property. I'll have you arrested."

Came howls of glee from the small boys, vigorous squirming to be free on the part of the dog; but the Captain held fast.

A good natured looking policeman glanced into the court, and seeing a small commotion, sauntered in to ask what it meant.

"Officer," the woman cried, "this man is trying to steal my dog."

"But it's my dog, officer," the unhappy Captain said, rather weakly. He was beginning to wonder if this was all a bad dream.

The officer with difficulty repressed an inclination to laugh and he looked at the struggling mite held fast by his captor.

"How about this?" he asked sharply. "The lady surely knows her own property. Do you want to go to the police station?"

A tall young man stepped up, and with a "Wait a minute, Jack," laid his hand on the shoulder of the officer, who wheeled about suddenly.

"Hullo, Fred!" he said in a pleasant voice. "Now where do you come in on this? Lady accuses old party of trying to steal her dog."

Fred Barton, for it was he, drew the policeman to one side and said something in a low tone. When they turned back both men were smiling.

The Captain still held the struggling dog but was beginning to wish the ground would open and swallow him out of sight, dog and all. He was thoroughly exhausted; his dignity was wounded; he had been threatened with arrest. Oh, why did he leave his peaceful home this Sunday morning in pursuit of a miserable dog?

Not knowing how his good offices would be received, but taking fate into his hands, Fred Barton turned to him and said:

"Captain Hayden, there has been a mistake. Your dog is at home in the yard. I was—at least—I happened to be—near when Cynthia missed you, and some one told her you had gone down the street after a small white dog. She asked me to follow and tell you that your dog is in the yard. Sorry I could not overtake you sooner, but you were out of sight around the corner and I did not know which way you had gone. It's all right, officer," he continued. "The lady gets her dog."

The Captain dropped the squirming dog at the feet of its irate owner and turned to young Barton.

"Fred," he said in a tone so meek it was almost pathetic. "Take me home. Take me anywhere, away from here."

"I'll have a taxi here in one minute, sir, and we'll be home in short order," returned Fred, and hastened away, his friend the policeman following in his wake.

A moment later into the welcome shelter of a taxi went the tired and crestfallen Captain, and with Fred accompanying him was soon speeding toward home.

Cynthia beamed as she saw Fred alight from the taxi in close attendance upon her uncle who looked at her rather suspiciously as they entered the house.

"Is that true," he asked, "that my dog is actually in the yard, and I'm a darned old fool?"

Cynthia laughed merrily.

"Oh, yes, Uncle," she said. "It's true that Neptune is in the yard. I'll bring him in," and vanished in the rear.

The Captain sank into his easy chair and gave a sigh of relief.

"Fred," he said, and the merry twinkle in his eyes belied his ill temper, "you'd better go help her to catch that dog. And say, Boy," as Fred, quite willing, started to follow Cynthia, "come in this evening to see us and try to bring your father along. Tell him I said so."

THE HOMEY THINGS

By Margarette Walker, Anaheim

In considering the homey parts of my life two scenes come to my mind. One is of the Sunday afternoon when our mother would gather us all around the organ and we would pour out our hearts and voices in a joyful hour of song. That scene was enacted, however, but once a week. The scene that seems more really to embody the sense of home took place nearly every evening. In it I see my father and mother, each reading, and three little people on their knees on chairs with elbows on the table while they eagerly devour the pictures and rhymes of their books. The scene sometimes changes when either the father or mother read aloud. I think I might be able to eliminate all of the luxuries from the home but the books and still enjoy my home if the books and magazines were good. You will see I think the library the homiest part of all. As Meredith says:

"You may live without friends,
You may live without cooks,
But civilized man cannot
Live without books."

THE HOMIEST THING

By Mrs. Laura T. Houghton, Calipatria

Why, it is music of course, but not a piano, banjo or any bought instrument, and it is not singing that suits my mind best. It is the gay whole-souled whistle of any member of the family who has God-given talent enough to make your pulse beat and heart awaken to all the music in that whistle. If you have ever had a fine whistler about and that whistler departed, did you miss that whistle? Didn't your home seem like the shades o' night, or lonelier?

Way back in the 60's I remember a neighbor boy who always whistled when taking his cows to and from the pasture. Although more than a half mile away his whistle came up musical and strong over those hills, and I would sit out on the horseblock and listen. There was much sadness in those days and our boy had gone to war.

Long since I was in a lumber camp and the homiest thing I found there was the whistle of three brothers. They called them the Dungie boys. One would stand outside to listen to their far departing whistles as they echoed through the deep woods. When the boys drove their sleighs out at 4:30 a. m. the thermometer was sometimes below zero, but getting cold was nothing when you got all that lovely whistling for nothing.

One summer was spent in the foothills of the Sierras. The boy who drove the stage from Auburn to Placer was a whistler. Everyone loved that whistle; the school children caught on and did their best to whistle his pretty tunes. Along this stage route are many Indian burying grounds and one tune he often whistled was "Red Wing." We wondered if it was in remembrance to their departed. It seemed quite appropriate anyway.

The farmer boy's favorite seemed to be "Rosalie, the Prairie Flower." I never had any boys of my own to whistle, but when our only grandchild was four years old we taught her to whistle. She is a fine whistler now and never fails to say, "Grandma taught me to whistle."

Now, all you who can whistle just try once and drive away your blues, if you have any, and if you haven't any you may drive away all sad thoughts from those who live with you and all within hearing. I hope there are others that have found joy and gladness in the musical whistle of at least one of their home folks. That whistle is certainly enjoyed at our house and when gone nothing is missed so much.

THE HOMIEST THING

By Mrs. Linda W. McNeil, San Jacinto

Many things both useful and beautiful go to the making of a home, but to my mind, aside from the three necessaries, food, fuel and clothing, the one thing which assures the permanence of the whole structure, is the presence of the Book of Books, the Bible, in the place of honor and with the look of service, as if it were valued at its just worth and used accordingly.

One of the earliest memories of childhood is a large leather bound Bible with time-stained pages, well thumbed, lying open upon an ancient stand of cherry wood. A pair of steel bowed spectacles lie upon it. The breeze from the open windows stirs the white muslin curtain softly and fills the room with the scent of June roses.

To my baby mind that plain little room with its blue woodwork, yellow floor and braided rugs was a shrine for some sacred thing, and when the sun was near its setting and grandfather sat beside the stand with the sunlight turning his grey hair to silver and read from the old brown book with his strong deep voice, it seemed as if Heaven were very near, and so today the dearest, homiest thing in the house to me is the Bible, the Book which points the way to Life Eternal.

The heart of the home? What is it, pray?
The tinkle of music, the children's play?
The shine of the fire, the lure of a book?
An easy chair, the art of the cook?
For me the simple things are best;
The scent of flowers, a breeze from the West.
Splashes of sunlight across the floor,
Red roses nodding beside the door,
A mocker's song from the pepper tree,
All are the "homey" things to me.

THE THING I THINK IS THE HOMIEST

By Helen Clark, Gilroy

The thing I think is the homiest is just to look out at the beautiful green trees and flower garden.

I remember when the trees were first set out and I used to run out and watch the men plant them. They were very little then, but now they are about four years old and they are very beautiful.

I have planted quite a few of our flowers and each year the flowers are prettier. It is very nice when you have beautiful flowers in your home and to take to the teacher. I always love to look out at the beautiful trees and flowers, and when they are in blossom they smell so sweet.

WHAT MAKES OUR HOUSE A HOME?

By Mrs. Chas. F. Casey, Pasadena

The things that have made our house a home, and life more comfortable and happy than the highest priced furniture or best paid chef ever could have done, has been the possession of a huge fireplace, even if it has adorned only a modest little home; also our ferns and flowers.

Admitting that a chaise longue, banked with down pillows, placed beside a lovely floor lamp, is a most comfortable place in which to rest and read, only one member of the family can enjoy it at one time, while the four in our family can circle around the cheerful fire. Often on a cold, rainy night we set our supper table near it and then who cares if it rains or the wind howls.

When the girls were young they enjoyed popping corn over the coals or throwing in a handful of "fairy fire" to see the wonderful colors it would produce, and telling stories. Then when older and along came a beau, it was still their favorite haunt, where they toasted the marshmallows "he" would bring. No doubt many times the coziness and cheerfulness of the open fire was preferred to a movie.

Even in summer we consider our fireplace our prettiest nook, with a jar of flowers on the broad mantel, a tall growing palm on either side of the hearth, and the wicker woodbasket filled with lovely wild flowers and grasses placed in the center. This, together with window boxes below our casement windows filled with ferns and colorful flowers makes for cheer all the year in this glorious Southland of California.

A PAINFUL MATTER

"Pat, it's lookin' seedy ye are. A shave wouldn't hurt you a bit."

"Faith, Moike, if yez could see me razor yez wouldn't say that."

Develop risibility!—
It conquers disability,
And gives to one a renovated life.
Be joyful and humorous,
For merry jests are numerous,
And practice on your kiddies and your wife.

A Vacation Opportunity
BARKER BROS.
Fortieth Anniversary Sale
And Annual
Summer Clearance

With $1,453,000 worth of Furniture and Home Furnishings offered at most decisively lowered prices involving **Savings of 10, 20, 25 and 33 1-3 per cent (and even in some cases as much as 40 per cent and 50 per cent).** It is a particular Vacation-time opportunity for two classes of Southern California home-lovers to better their homes.

Those who come to Los Angeles on their vacation during this Sale and Clearance will find the lowered prices—the savings to be enjoyed on merchandise throughout this store—of such extent and reality that it will be possible in many instances to pay the expenses of their vacation from the savings in cost on their Furniture purchases. Or these savings might mean a longer, better vacation.

Those who will not be in Los Angeles for their vacation this summer, who have decided instead to stay at home and create their own enjoyment by "doing over" some part of their home's furnishing, through a renewal of part of its Furniture, its Floor Coverings or its Draperies, have the same opportunity to save, to enjoy the reduced prices of this sale. It is their privilege to buy by mail at exactly the same favorable sale prices and terms as those able to come to the store in person.

Barker Bros.' Mail Order Department serves thousands every month who find it impossible or impractical to come to Los Angeles. It brings this great, interesting store right to your door—it serves you with the same consideration and courtesy as though you were here in person—it brings you the benefits at this time of reductions in price on more than ten thousand pieces of furniture.

Inquiries by mail have prompt attention the same day as received

BEANS

California Lima Bean Growers Association, June 12:

Lima beans have been selling fairly freely during the past week and at recent rate of selling stock will be entirely disposed of within the next few weeks. Weather conditions have been favorable and fields planted to Lima and Baby Lima beans are generally thrifty and showing a good growth. If favorable weather should continue throughout June and July and up to the 10th of August the outlook is for a fair crop upon the greater portion of the acreage planted.

HAY

Alfalfa Growers of California, under date of June 16, says:

The market for alfalfa hay continues strong in all parts of the state. Receipts in principal markets continue remarkably light for this time of the year. Dealers and consumers in smaller centers in interior are free buyers at prices which net the grower more than present Los Angeles and San Francisco prices. Alfalfa acreage is not keeping step with increasing consumption, the result of growing population. Also the former growers have changed to what they consider better paying crops, becoming buyers of hay instead of sellers. Mr. Daniels, state market director, predicts serious shortage of milk, especially in the large cities such as Los Angeles and San Francisco and declares that he has authentic information that in various parts of the state many of the dairymen are auctioning off their herds or selling cows to the butcher. The decrease in the acreage would be still more marked than it is if it were not for the effort of this association in encouraging the growers to stick it out in the hope of better times for them.

Prices as low as $12.00 and $13.00 a ton to the grower during the principal selling season in the last few years discouraged the producer of hay for marketing purposes. He was losing money, and it did not do him much good that the following winters the price went up to $35, and even higher, as he then had little or nothing to sell.

After all is said, the only way to bring about increased production of alfalfa, or, for that matter, any other crop is attractive prices, that is prices which compare fairly well with the returns from other crops; everything considered, together with some assurance of a fairly stable market; extremely high prices are almost as detrimental to the grower in the final result as are extremely low prices.

Prices in California today are as follows in southern districts:

Choice alfalfa, 40.00 per ton, No. 1 dairy, 36.00; standard dairy, 32.00, stock alfalfa, 29.00.

GRAIN AND FEEDS

Price bid local grain exch. cwt., June 15:
Barley: Carlots, 2.77½.
Milo: 2.82½.
Kafir: 2.82½.

San Francisco Markets

BEANS AND PEAS

California Bean Growers Association, San Francisco, June 14:

Market rather inactive so far this month and bean trade not likely to show much real interest until July. Kotenashis are held firm at price of 4.90@5.25 delivered San Francisco to arrive.

Small Whites, 5.90@6.15; Large Whites, 6.35@6.50; Pinks, 6.45@6.60; Blackeyes, 8.50@8.75; Mexican Reds, 8.50@8.75; Red Kidneys, 14.00@14.50; Bayos, 10.50@10.75; Cranberries, 6.75@7.00.

Dried Peas: California, 5.00@5.25 cental.

Lentils: California, 11@11½ per lb.; Chile, 12 per lb.

HOPS

1919 crop, 1.00@1.05 per lb. Prices to growers for 1920 crop, 75@80 per lb.

HONEY

Old crop is scarce and hard to quote.
New white orange extracted is 21, f. o. b.

GRAIN

Wheat: The prices are based upon Federal grades and standards at the terminals in San Francisco bay and Los Angeles and are as follows per bushel of 60 pounds:

Hard White—	Per Bus.	Per Cen.
No. 1	$2.20	$3.63 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	$2.13	$3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51⅓
Club and Sonora—		
No. 1	$2.16	$3.60
No. 2	2.13	3.58
No. 3	2.00	3.48 1-3

The above are minimum prices.

For sacked grain add 4½ cents per bushel to the above prices. Deduction of three-fourths of a pound made for weight of standard grain bags. Wheat grading under No. 3 mixed or smutty wheat will be purchased according to merit.

Oats: Red feed, 3.15@3.25.

Corn: California Yellow, 3.70@3.80 per cental; Egyptian White, 4.25@4.35; California milo maize, 3.45@3.50.

Barley: No. 1 feed, 3.10@3.20.

HAY

Under date of June 12, Scott-Magner, Miller, say:

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Fancy wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat and Wheat and Oat hay	35.00@38.00
No. 2 Wheat and Wheat and Oat hay	32.00@35.00
Choice Tame Oat hay	37.00@40.00
Wild Oat hay	Nominal
Other Tame Oat hay	33.00@37.00
Barley hay	Nominal
Alfalfa hay new	25.00@30.00
Alfalfa hay, old	30.00@32.00
Stock hay	29.00@32.00
Oregon Cheat and Oat hay	29.00@32.00
No. 1 Barley straw, bale	70@1.00

Alfalfa Growers of California quote prices for Northern Districts:

No. 1 Dairy Alfalfa	32.00
Standard Dairy	30.00
Stock Alfalfa	27.00

Citrus Markets

Los Angeles, June 16, 1920.

The orange market shows remarkable strength. The auctions sometimes show as high as $8.00 sales, and f. o. b. quotations are playing around $4.50 to $5.50 prices.

The lemon situation remains desperately flat. The weather has warmed slightly in some Eastern sections but with nearly 150,000 boxes of foreigns within sight of Atlantic ports there will be no long prices for sometime to come.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 21,559 cars; lemons, 5,130; total, 26,689. To same date last season: Oranges, 25,078; lemons, 6,514; total, 31,592. From Central California to date this season: Oranges, 5,339; lemons, 288; total, 5,647. To same date last season: Oranges, 3,668; lemons, 251; total, 3,919. Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

THE POULTRY AND EGG SITUATION

Under date of June 11 the Poultry Producers of Southern California, Inc., sends out a letter to members reviewing the broiler and egg situation. It is so interesting we quote almost entire:

"Broilers: We have previously reported the sale of two cars of broilers at good prices. We have just learned today that the third car has been sold and is to be shipped next week. All of these sales have been made at a premium over the market.

"At the meeting of our executive committee held last Friday it was decided not to accept any more broiler marketing agreements during this season except from those shippers who will certify that they have not marketed any broilers subsequent to March 15, 1920, the date of our broiler marketing agreement. The purpose of this action is to prevent those who have sold broilers outside the association during the first part of the season from participating in profits earned by those who have marketed through the association throughout the year.

"Broiler marketing members have during the week been advised by letter of a local strike among chicken pickers and have been requested not to make any more deliveries until further notice. The National Poultry Company informs us today that they are getting along fairly well and that they expect to notify us the first of next week that they can accept deliveries as usual. Immediately upon receipt of such advice from them, we will notify all signers of our broiler marketing agreement."

Since this letter was sent out this strike situation is cleared and the association is sending out word that broilers may now be brought in freely.

"It might be stated in connection with broiler operations that the Los Angeles broiler market has for sometime been above the Petaluma market.

"New York Shipments: Since our last letter we have shipped to the New York market 2,280 cases of our White Extra candled eggs. Inasmuch as our egg market has for the past month been the highest on the Coast, we are gratified at being able to sell five cars of our Extra eggs at a higher price than buyers were paying for white eggs in other markets. These five cars were sold for cash, f. o. b. Los Angeles, without inspection, and were sold to three different parties, each of whom had previously handled our pack of eggs, and knew that we would ship him a car of fancy, well graded eggs. Each was satisfied, therefore, to pay for the eggs before they were shipped.

"We hope to be able to continue making Eastern shipments, and urge our members to keep their eggs clean. As the weather gets warmer it becomes necessary to make more frequent deliveries to us—deliveries should be made at least twice a week. Gather your eggs twice a day and be sure to keep them in a cool place. Eggs quickly show the effects of hot weather.

"Empty Cases: The problem of providing sufficient fillers to keep our business going has been a hard one. The cost of new cases and fillers this spring has been a little more than 60 cents per case, or two cents per dozen eggs. The northern association has been charging its shippers two cents per dozen for cases this season. Of course we use a good many second-hand cases, but during the storing season all of our eggs are transferred to new cases and filiers. Our New York shipments, too, are always made in new cases and fillers.

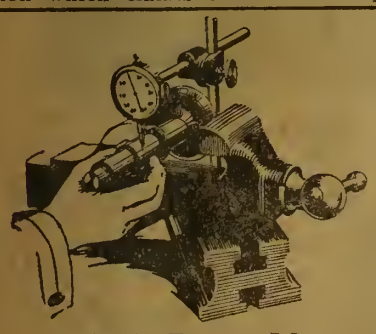
FISH OR CUT BAIT

Prune and apricot growers who become members of the California Prune and Apricot Growers, Inc., the growers' state wide cooperative organization which claims to market 75 per cent of the prunes and apricots produced in California, after prices have been set for the 1920 crops, will not be permitted to sell their 1920 crops of dried fruit through the association, according to a resolution which has just been passed by the board of directors of the association.

This action was taken, according to a statement made today by the association's management, to prevent non-member fruit growers from benefiting at the expense of the association's members, as has been done in the past.

Heretofore it has been the practice of some non-member fruit growers to hold their crops until after the association had set the price it would pay its members for their fruit; then, if the non-members could get a higher price from the private packer, they would join the association. The association believes that its recent action will stop outside growers from thus playing both ends against the middle.

Because of the success which the association had last year in obtaining top prices for its prunes and apricots, fewer growers than ever are selling to private packers this year. But if these non-members should decide to join the association and turn over their fruit to it after a price was named, such a large tonnage might be offered the association to sell that the average return to the present membership might be seriously affected.



Is It Round?

Just as dimensions are controlled within a 100,000th part of an inch, so are the all-important details of roundness, hardness and other essentials in the making of the "Caterpillar" Tractor—the world's highest grade tractor—proved by the finest instruments. You will have a new idea of "Accuracy" after reading our booklet by that name.

WHAT SPLIT HALF DOME IN YOSEMITE?

Half Dome, split in twain, towers in a group of almost perfect dome shaped mountains. This question has puzzled tens of thousands of Yosemite visitors. Early geologists leaned toward theories of glacial action and mighty earthquakes. The part played by constant erosion by cobblestones in swift mountain streams has been given much more emphasis as our knowledge of the mighty forces that made Yosemite Valley has increased.

The government, trying to satisfy these inquiries of Yosemite visitors, has been making a careful study of Yosemite National Park geology. An up to date booklet, abundantly illustrated, by Government Geologist F. E. Matthes, can be had from Superintendent of Documents, Washington, D. C. Nature study hikes are offered through the cooperation of the federal government with the state fish and game commission. High power scientists will be in charge. Among these will be Dr. E. C. Bryant of the University of California, who has a wide knowledge of high Sierran life, and Dr. Loye H. Miller, the Los Angeles biologist, who has an almost uncanny ability in imitating the songs of wild birds.

This year's Yosemite nature guide program is about a 400 per cent increase over last year's highly successful one at Tahoe. It will include directed nature play for children such as the blindfold "herb smelling" and "bark feeling" games. There will be directed hikes for children and grown-ups. Evening campfire talks on the mammals, birds, trees and wild flowers of Yosemite National Park, and on the fun of sleeping bag trips into the high Sierra will also be featured, as well as lantern slide talks and movies of high Sierran wild life.

THE REAL PYGMIES

Living in the mountains of the strip of land that juts down between the Indian Ocean and the South China Sea, says Eva Chappell in Everyland, are the strangest little folk that I know about in all the world. They are the Pygmies of the Malay peninsula. The tallest of their tall men is proud indeed if his kinky black head reaches more than four feet ten inches up the side of the tree in which he lives. Not that he knows anything about feet and inches, for he has never heard of a yardstick, and would only know that he is tall by measuring himself by those about him. But the height of these little people does not prevent them from having a fine, commanding view of the world, for they build themselves little houses of grass and palm leaves in the tops of trees. And when they need a change of scene they move down to the shelter of an overhanging rock. These changes are needed often; indeed, the Pygmies hardly ever stay longer than five days in any one place.

BASEBALL IN MEXICO

In Mexico baseball will be a matter of evolution rather than adoption. At the outset a game will proceed along these general lines:

Prior to the opening day, a parade of picadors, matadors and toreadors about the diamond.

Liberation of the umpire, and beginning of the game.

After first inning, siesta for infielders.

After second inning, umpire is pursued by picadors.

After third inning, siesta for outfielders.

After fourth inning, pursuit of umpire by picadors and matadors, twice around the bases.

After fifth inning, pitcher and catcher take siesta.

After sixth inning, massacre of the umpire by picadors, matadors and toreadors. Fresh umpire liberated and game continues.

After seventh inning, siesta for spectators; grandstandistas, bleacheristas, freelistas, everybody.

After eighth inning, official announcement that the game will be concluded "manana."

Final spectacle: Revolution among players and burning of the grandstand. Looting of box office. Looting of safe. General looting. Mescal. "Watchful waiting" for umpire.

Prolonged siesta for umpire.—Cartoons Magazine.

BAKED STORIES

"It's in the oven!" That was the ancient Babylonian version of the modern printer's "It's on the press." When a native of Babylon or Egypt wanted to "write,' he shaped soft clay into little bricks. On these bricks he scratched signs, sometimes pictures, which stood for letters, words or ideas. His "pencil" was an oyster shell or a piece of broken pot. After he finished his story, he had it baked in an oven or dried in the sun. Later the Egyptians found that the pith of the papyrus—a plant growing in the Nile Valley—made a good foundation for writing; so they scratched "papyrus letters," using a reed pen and ink made from gall nuts and sulphate of iron. For hundreds of years papyrus was the world's "writing paper." But when Mohammed conquered Egypt, Europeans could not get papyrus; so they used a fine leather instead. Even today leather is sometimes used—only we call it parchment.—Everyland.

NEW BELLS MADE LIKE OLD

We have often heard the beautiful silver tons of very old church bells in Europe and some have even been bought at a great price and brought to America. It was supposed that after a bell had rung regularly for one or two centuries some mysterious quality was developed and the beautiful tone could be acquired in no other way. An ingenious American studied the problem, however, and decided that the silver tone was simply due to the fact that the clapper of the bell had worn itself and the bell by continued striking, until the two fit closely together, and that the shape of the metal and nothing else determined the tone. He began to make bells by casting them so that the clapper and the bell fit each other properly, and the mellow silver tone was obtained at once. Today we are manufacturing such bells and selling them abroad.—Boys' Life.

EQUAL TO THE EMERGENCY

Collection money was to little Tommy one of the essentials of churchgoing. Every Sunday morning he saw that his penny was ready. One day, just as the ushers began to take the collection, Tommy noticed that a guest in the family pew was not duly provided. Sliding along the seat, he whispered:

"Where's your penny?"

"I didn't bring mine," replied the lady.

Time was short and the matter was urgent, but Tommy was quick witted. Thrusting his penny into the lady's hand, he whispered:

"Here, take mine! It'll pay for you and I'll get under the seat!"—Pittsburg Chronicle-Telegraph.

Grapes from the Coachella Valley are being shipped to Eastern points, an estimated crop of 100 carloads.

POULTRY AT STATE FAIR

The California State Fair Association is sending out its Poultry, Pigeon and Pet Stock premium list, together with entry blanks. Entries close August 30. Director in charge of the poultry department is E. F. Mitchell. Poultry people can secure premium list by writing Chas. W. Paine, Sacramento.

WEATHER REPORT

San Francisco, California, June 12, 1920.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.

What's going on inside?

THE mysterious process by which feed is converted into eggs—and eggs *into money*—is no mystery at all to the poultryman who uses SURELAY. You know that nature provides each laying hen with just so many eggs in embryo. After that it's up to the hen—and to you!

If you let Mrs. Hen follow her own lazy inclination in the matter, she may take six or seven years to produce her quota of eggs. Not much profit in that—is there? So, its up to you to see that she produces her full supply of eggs in *two or three years.*

That's why she must be *fed into action.* But, the elements of an egg are derived from so many sources that no single food will answer the purpose. Hence the need of a uniform, balanced feed like SURELAY. For, it contains at least a dozen ingredients blended and mixed more skillfully than can possibly be done by hand. It is made so good, so tasty, that every time Mrs. Hen takes a peck of SURELAY she is eating a little of everything that goes to make up an egg.

The poultryman who consistently uses SURELAY never has to worry about what's going on inside. He knows that all's well with the hen because all's well with the feed. SURELAY contains no harmful stimulants, no questionable "scraps," no adulterated substances. It is a clean, prime feed that has stood the test of time.

And SURELAY is always the same—always uniform! Our daily laboratory tests make sure of that! No guess-work! You know that "what's on the sack is in the sack—and that's what makes the eggs."

If you want to get down into the vitals of this feeding question—if you want to see why SURELAY has won the favor of millions of hens and the faith of thousands of poultrymen—send for our booklet, "Makes Hens Happy." Simply cut out the coupon and mail today—it's free!

Learning by Doing

THIS matter of learning things—the knowing how—is one long problem. At one time the son of David, king in Jerusalem, suggested: "In much wisdom is much grief." But at another time he did conclude: "Wisdom is the principal thing, therefore get wisdom; and with all thy getting, get understanding."

The Finished Product Ready for Market

After three or four days in seed bed nursery row where they are trained, pruned and made ready for the orchard, the trees are then ready for the market. A trench is dug along the entire row and dirt is sifted away from around the tree and left in form of a ball. Burlap is tied firmly to the trees, and they are started in lath houses where they become "established," even start a new growth, and they may be placed in the orchard where the growth will continue without the faintest check. Members of the University of California citriculture class observing the operation.

The farmer in California has been obeying this last injunction for many years, though the newness of the problem still makes producers under California conditions pioneers. California's problems are as diverse as are her climatic, soil and other conditions. Hence this state many years ago started the plan of conducting a movable farmer's institute, going from farm to farm or orchard to orchard. This plan has been enlarged upon and improved by farm bureaus, by classes of the University of California, high school clubs, and innumerable other organizations. The most recent trip of this kind has just ended at Pasadena.

On May 6 a score of students, members of Dr. J. Eliot Coit's classes, who had spent four years in mastering the academic side of California's horticulture, determined to see at first hand the methods as practiced in the orchards. They realized the state's diversity and the fact that the best of orchards in one section was no indication of methods which would be best in another.

Their autos were first headed northward from Berkeley. They first made a long elliptic, something like a kite, and later added a tail to it by running their machines over the Tehachapi and down into Southern California. Dozens of different sections were visited, amongst which are Sacramento, Loomis, Penryn, Auburn, Marysville, Oroville, Chico, Durham, Red Bluff, (this was the northernmost point), Corning, Hamilton City, Monroeville, Orland, Willows, Maxwell, Davis, Elk Grove, Modesto, Turlock, Fresno, Sultana, Exeter, Lindsay, Porterville, Bakersfield, then over Tehachapi, touching points in-(Continued on Page 1017.)

A Five Year War Veteran From South Africa

The gentleman at the right is C. H. F. Woolley of Nieu we Hoop, Simondum, Cape Province. Captain Woolley is in California gathering information which will be of value to South African orange growers. He is in charge of ranch properties which in former years have used two carloads of California grown Washington Navel orange trees. The trees made the 10,000 mile trip safely and are now bearing Washington Navel oranges.

Learning Budding by Doing It

University of California class in citriculture doing field budding of citrus trees. Man in center with X on shirt is W. T. Preston whose whole life has been spent in the budding game. He is now in charge of the budding in the Teague Nurseries.

Firestone

Alone in the tire field—the Firestone 3½ takes its place beside the half dozen products of universal use which manufacturing genius has made standard.

Built in a specialized factory—by experts—with all the economy of concentrated production.

What the bulk of the people accept as the standard of value is right.

You owners of small cars can forget tire details—you need not bother with methods, features, or guarantees. Call for the Firestone 3½.

Agricultural Graduate and the State

In an address before the agricultural club of the University of California early in April, Dean Hunt referred to the fact that young men and women trained in agriculture by the agricultural college of the university were becoming a great factor in the state's upbuilding. In that address he gave instances of California young men who have become moving spirits in the upbuilding of the state. Dean Hunt maintains that "there is no finer nor better trained body of agricultural graduates anywhere than those who have graduated from the college of agriculture during the past ten or 15 years."

In the address before the agricultural club, Dr. Hunt referred to his 40 years of active interest in agricultural education and gave many instances of graduates from various educational institutions who have been fitted for a great work in the nation's upbuilding. From these we take the following having to do with California young men:

By Dean Thomas F. Hunt

A NATIVE son graduated from the college of agriculture of the University of California in 1907. During his college course he was active in student affairs, including athletics, which no doubt led him to be made private secretary to the president of the university. After serving in this capacity he became superintendent of the Miller & Lux ranches for a short period. Eight years ago he was called back to the university as comptroller, next to the presidency, the highest position in the institution. In this capacity he has managed also the Kearney Ranch of 5,000 acres, with an annual net income ranging from $40,000 to $90,000. Almost exactly ten years after Ralph P. Merritt graduated from the college of agriculture at the University of California the president of the United States named him food administrator for California. He was generally recognized as one of the three most able state food administrators during the war. However, the purpose is not to praise Mr. Merritt, but to point out that here is one of your own number who is yet so young that he is known to most people by his first name, who has had an opportunity for usefulness such as should satisfy the red blood in any young man's veins.

Thus far I have been stressing, as I think I should, the service that certain agricultural graduates have been called upon to render. I realize, however, that every young man is born into the world with his clothes off. About the time he becomes 21, without capital and with only his head and his hands, he wonders how he can combine these two organs to make a living. I will give you one such example—doubtless a somewhat unusual one, but nevertheless it was possible to any number of other boys had they only combined their head and hands to seize similar opportunities that have been scattered all over California, and doubtless such opportunities will continue to exist for all time.

In 1905 a small, red headed, freckled faced, smiling lad, then known and still known as Joe Moody, entered the college of architecture of the University of California. Later he discovered that while he had the initials all right he was in the wrong college. He changed over to agriculture, graduating in 1909. According to his own story, he started out after graduation with a degree, two strong hands and a good wife—nothing more. It was enough. He bought 40 acres of land and went into debt for it, made possible because someone had faith enough to grubstake him. Nine years later I heard him say that as he looked over his university classmates he noted that they had prospered generally, but that he was about the only one who owned the roof over his head. Most of the others, while successful enough, lived in rented houses beside paved streets.

Of course last year the conditions were unusual. In California conditions, like the weather, are generally unusual. Nevertheless, if you must know whether a man can support a wife and rear a family on a farm in California, I will tell you that Mr. Moody's gross income from 40 acres in 1919 was $19,000. He sold $13,000 worth of table grapes from 16 acres and the buyer picked them. He has purchased an additional 120 acres, which he is setting out to fruit. I dare not tell you what he thinks he will be worth in another ten years.

I might come down to later graduates, such as Donald E. Graham of Lancaster of the class of 1912, who is easily the leading farmer of Antelope Valley, specializing in pears and Berkshire swine; or David Brant, class of 1914, of Owensmouth, San Fernando Valley, probably the leading breeder of Guernsey cattle in California. I cannot go on naming all of these graduates; there are too many of them.

Let us see whether we can summarize the situation:

I have here a list of 106 graduates who have taken higher degrees from the college of agriculture—12 doctors and 94 masters degrees. Here is another list of about 650 persons who have taken bachelor's degrees, and still another of about 250 persons who have received diplomas from the university farm school. The sum, you will notice, totals about 1,000. There is some duplication, but when the 1920 classes have graduated the college of agriculture will have given degrees or diplomas to at least 1,000 different persons. Of the 106 who have taken advanced degrees, 38 are instructors. Nineteen of these are connected with the University of California; 11 are with other institutions, while eight are high school teachers. There are 20 research workers and chemists, including workers in the United States department of agriculture. Eleven are operating ranches. Of those whose occupations are known all but five are employed in work for which their training fitted them. Among the men who have taken bachelor's degrees, 203 are ranchers, 112 are teachers of agriculture or otherwise employed in educational institutions, 105 are engaged along other agricultural lines such as horticultural commissioners, agricultural chemists, irrigation engineers, managers or employees of fruit packing plants and farmers cooperative associations, while 66 are known to be in other lines than agriculture, including salesmen and real estate agents.

These men and women are gradually becoming an important factor in the agriculture of the state. There is scarcely an organization or activity of the farmers of California that does not employ one or more agricultural graduates. Not all are graduates of the college of agriculture of the University of California, but no matter what college of agriculture they are from, they are doing their part to strengthen the rural life of California.

Listen to this letter from the California Packing Corporation, the greatest institution of its kind anywhere, written under date of April 5, 1920:

"We have on our various ranches several graduates of the University of California and also a good many young men who have not gone farther than a high school education. It is the policy of the corporation to make promotions in our ranks from material that we have, rather than take outside people, provided that they prove themselves fit for promotion. With that in view I have for some time been trying to figure out a scheme whereby we could get these young men interested in continuing their studies in the agricultural line but have been unable so far to think out any program that would be practical, and am writing you, therefore, for advice.

"It has occurred to me that it might be possible to make some arrangements with the university extension to have a correspondence course, and then have the boys on each ranch form into a club and every once in a while someone from the university give them a talk on a live subject. For instance, when they are spraying for red spider we could have someone give them a talk on this subject, and so on with other things. This would make the boys realize what they are doing the work for and make it more interesting to them. We would be willing to go to some expense if necessary to do this, and possibly have the boys pay a small charge so as to make them feel that they are not getting something for nothing."

This letter is fairly indicative of the change that is coming about in California. Formerly, although the superintendents of the large ranches were capable enough, they were generally self made men without college education. They all too often either despised the college graduate as a white collared good-for-nothing, or were afraid of him for fear he might know more than they did. It was difficult for the college man to maintain himself under their dislike or suspicion. In spite of this serious handicap the students of the college of agriculture have been successful. Indeed, they are succeeding beyond our fondest expectations. In due time they are becoming the superintendents of the larger ranches and agricultural industries. The last three years has seen a decided change in the attitude toward the college graduate, as indicated by the inquiries received in the dean's office. Formerly, too, many letters were received from men who wanted laborers at less than the ruling rate. Now we are receiving more requests for trained men than are available. When I say trained men I mean really trained men—upstanding graduates with two or three years of actual experience beyond their college days. It generally takes two or more years for the graduate to get the college out of his system.

It is not difficult to understand the opportunity that this new situation offers to the recent graduate. Other things equal, the college bred superintendent, when looking for an assistant, will prefer a graduate because he is the sort of man with whom he likes to be associated. Furthermore, he does not expect too much of him; he appreciates how little he knows when he graduates, because he knows how little he knew when he graduated. Having been a college student, he knows how to go about it to find the type of young man he wants. There is much yet to be accomplished, but this movement is like a snowball—the larger it grows the more snow it gathers.

During the year 1919 we had an average of one request every day for men with college training. It is definitely known that we placed 81 college men, 24 farm school men and three ex-students. In other words, we filled one out of four of these requests. It is probable that more than this number were actually placed, since the persons given include only those who have subsequently written notifying us of the fact.

In another ten years there will doubtless be in California 1,000 graduates of the college of agriculture and the university farm school between the ages of 30 and 45 years, the ages between which men do things. If these 1,000 men do not become the most important factor in the material and social welfare of all those who live in the open spaces of California, then the college of agriculture will not have been worth its salt.

Without doubt your first duty is to earn a sufficient living to rear and educate a family. That is the first duty of every man. But if, in addition to this fundamental requirement, these thousand men who have had the unusual advantages furnished by the state for a special purpose, do not lead in every progressive enterprise which affects the agriculture of California, then the college will have been a failure and should be abolished.

Circumstances are such that in the future the representatives of agriculture are going to be heard in the councils of the nation as never before. Whether these hearings will result in the good of humanity must be largely determined by the agricultural college graduate, whose vision has been broadened and whose courage has been strengthened by the most thorough education which it is possible for a beneficent state to give him.

Agricultural News Notes of the Pacific Coast

Northern California

Lake County is making a drive on Canada thistle.

Napa County farm bureau will conduct a county fair.

San Jose reports a serious shortage of cherry pickers.

The farm bureau of Tehama County has opened a public market at Corning.

Haywards, Alameda County, will hold a farm products show, August 12-15.

Siskiyou County is developing water from many sources not heretofore availed of.

Mendocino County farm bureau sheep men are planning a pool of spring wool.

The cannery at Haywards, Alameda County, started on cherries about the first of June.

Santa Rosa is to have a $250,000 fruit cannery in operation for this season's crop.

Maxwell, Colusa County, has one of the newest and finest lemon packing houses in the state.

The increase in rice acreage now planted in Colusa County over that of 1919, is 24,000 acres.

A 20 acre peach orchard in Sutter County sold for $37,000, or $1,850 an acre, the highest price yet recorded.

Oroville, Butte County, is preparing for its biggest and best orange and olive exposition, to be held November 15-20.

Anderson-Cottonwood irrigation district has just voted $200,000 for improvements to the million dollar irrigation project.

California shows an increase of one per cent in its alfalfa acreage over last year, but the condition of the crop is 89 per cent of normal.

Sonoma County fair management claims it will have on exhibition the grand champion Berkshire sow of the world. Fair begins August 23.

The Nurserymen's Bud Selection Association is conferring with cling peach growers of Sutter County as to the best canning varieties for that county.

Sam Marple, "professional wolfer," killed 51 coyotes in Sutter County during May. The county pays him $255 bounty and the sheep men a like amount.

All power companies of California from Los Angeles to the Oregon line are now operated as a single unit under general direction of the state railway commission.

The state industrial commission at Sacramento has sent out notices that the $16 a week minimum wage for female agricultural workers becomes effective June 24.

Oroville is already making plans for her olive and orange show to be held in the fall. Farm bureaus of Butte and adjoining counties will cooperate in making the show a success.

At the recent meeting in San Francisco of the newly organized California Grape Growers Exchange, E. M. Sheehan was elected manager. Other officers are C. E. Humbert of Cloverdale and Frank T. Swett of Martinez, vice-presidents; H. S. Stoll, San Francisco, secretary; and George M. Bowles, San Francisco, treasurer.

Central California

A new cannery is in operation at Reedley, Fresno County.

Turlock section has planted 250 acres to a trial plot of cotton.

Stanislaus County will make large exhibit at the coming state fair.

The wheat crop for the valley will be materially smaller thau that of last year.

Raisins are quoted by dried fruit houses outside the association at 15 cents.

New fruit packing houses will be operated at Parlier and Sanger, Fresno County.

Owens Valley farmers are finding the shortage of water not so serious as anticipated.

California Peach Growers, Inc., did a gross business during the last year of over nine millions.

Madera County ranchers now harvesting barley report the yield much greater than expected.

Over 300 dairymen attended the recent dairymens' convention near Salinas, Monterey County.

Fruit growers near Sacramento are finding Japanese demands for wages and commissions excessive.

Stanislaus County melon growers are trying out a dry nicotine-sulphate-kaolin mixture on melon thrips.

Box shook for the coming cantaloupe crop is being received in large quantities at Turlock packing sheds.

Tulare Cooperative Poultry Association did its largest business during the month of May. The total was $33,600.

San Jose industrial exposition no sooner over than plans are in the making for another and greater next year.

Terra Bella, Tulare County, fruit buyers are paying around $100 a ton for cling peaches and $75 per ton for apricots.

The dried fruit associations of California hope to harvest the coming season's crop without serious differences over wages and hours.

The state department of engineering estimates that the proposed Pine Flat project will supply water for a million acres of San Joaquin Valley land.

Cotton growers of San Joaquin Valley met at Madera and listened to an address by a cotton expert. Madera County's planting will be greatly increased.

Bishop, Inyo County, is complaining of the negligence which permits thousands of fine large trout to float with the irrigation water onto alfalfa lands and be destroyed.

Green fruit shippers of the Fresno territory recently conferred with railway people and have agreed on special fruit train movements on same schedule as last year.

The outlook for fig prices during the coming year is anything but promising, according to the California Peach Growers, Inc. Importations of figs from Smyrna, which are selling at eight and one-half cents at auction in New York, have demoralized the market. An effort is being made to sign up the fig acreage in the state of California with the California Peach Growers, Inc. Unless such an organization is perfected, the growing of figs will become unprofitable, it is pointed out.

Southern California

Cypress, Orange County, has a new farm bureau center.

Many ranchers in Ventura County have shifted from beans to beets this year.

The Covina Citrus Association has completed its new packing house at a cost of $120,000.

The citriculture class of the University of California last week visited the date gardens in Coachella Valley.

Eight hundred acres of apricots in Orange County are signed up with the Prune and Apricot Growers Association.

Pomona canneries are busy getting ready for the initial run on apricots, perhaps the last of June; if not, the first week in July.

The state of California has bought 300 acres of land at Riverside for a branch farm school for the University of California.

Manager Halladay of the Anaheim Orange Growers estimates that the output of his district this season will be over 2,000 cars.

The Deglet Noor Date Growers Association has just sent circular to all members urging care in packing best grade of fruit to get maximum prices.

Several road meetings have been held by the state highway commission with residents of the section between Fallbrook and Vista, San Diego County.

Because of the short crop of apricots it is thought that the cannery at Elsinore will not open this season, the fruit being taken to the Ontario plant.

Orange County farmers last week took part in a rodent control campaign under the leadership of W. C. Jacobsen, state superintendent of rodent control.

The Imperial Valley shipped 2,000 cars of cantaloupes the first week in June, with 250 cars a day since then, 400 cars being needed on some days, but not available.

The cannery of the California Growers Association at Riverside will probably open June 28. The cooperative owners have lately spent $15,000 on the building and $25,000 on appliances.

Farmers of Orange County are taking steps toward forming the Farmers Cooperative League. The league will operate a cooperative employment bureau and will make itself generally useful to members.

The marketing committee of the Hemet Fruit Growers Association has notified members that there is no reason to change the first recommendation as to price for apricots and peaches, $90 per ton for apricots and $20 difference in the price of clings and freestones. There is strong sentiment in favor of getting all growers of the county together in a marketing association.

A large crowd attended on the evening of June 14 the formal opening of the new packing house of the Placentia Mutual Orange Growers Association at Placentia. The new building is of hollow tile and concrete and is 100 by 241 feet. The dairy department of the Orange County farm bureau is conducting a drive for members. The campaigners report: "Shortage of milkers in some instances has kept the boss' head against the flank of the cow."

The Coast and General

The resources of the banks of Arizona have increased $22,741,437.97 since one year ago.

A Yakima, Washington, ranch owner recently sold 2,500 pure Lincoln and Romney ewes for $50,000.

The Kansas Honey Producers League has been organized to bring beekeepers in closer touch.

Reno, Nevada, reports continued light frosts have seriously retarded alfalfa and damaged beans, tomatoes and potatoes.

At Tacoma recently 26 district leaders in farm home economics from the Puyallup Valley met to discuss their various problems.

At Rampart experiment station, Alaska, an alfalfa has been developed that will stand 70 degrees below freezing without killing.

The Cathlamet State bank of Washington has offered to loan any boy or girl the money with which to buy pure bred heifers.

Officials of three farm bureaus met at Mesa, Arizona, on June 8 and agreed to pay the one price of $3 a day for all general farm labor.

The crop of Garbanzo beans from the Mayo River Valley of Sonora, Mexico, is expected to be about normal, 220,000 sacks of 220 pounds each.

The Southwest Cotton Company, whose business is raising cotton, has put up 1,000 tons of hay for the first cutting on its plantation at Goodyear.

A highway commission bill will be submitted to the voters for initiation into law provided that sufficient signatures are obtained to the petition, which is soon to be circulated.

An auto camp ground south of the city of Phoenix, Arizona, is being established to take care of the needs temporarily of the auto traveling public. It is expected that permanent grounds will be established within the next year.

State Veterinarian Dr. R. J. Hight is urging the people of Arizona to enact legislation for the purpose of eradicating tuberculosis in cattle. He is of the opinion that it is necessary to have legislation of this kind which would be uniform with that of practically all states in the union.

Commissioner Cato Sells of the Indian depratment has announced that 27,000 acres in the Florence Casa Grande Valley will be irrigated by the diversion dam which the Indian department will build shortly. This is in addition to the proposed San Carlos reservoir, which would irrigate a considerably larger acreage. Part of this will be available for the Indian reservation and a part for white settlers.

As a result of a ruling made by the federal farm loan board at Washington, farmers holding laud under a government irrigation project will be able to borrow money from the United States government the same as other farmers throughout the Uuited States. Up until this recent ruling the law was interpreted to mean that the lien held by the government on the land for the payment of the project was virtually a mortgage which preveuted loaning funds. In the Salt River Valley the Salt River Valley Water Users Association will take care of all the details relative to farm loans of this character.

Harvesting Hay Efficiently

By Arthur L. Dahl

WITH an estimated production of over 111 million tons of hay, the United States will harvest this year the greatest forage crop in its history. Owing to the severe shortage of farm labor, many acres that would ordinarily have been planted to food crops were utilized for feed because the necessary work could not be put into the land to raise grain.

The labor shortage is not any less today in this harvest season than it was during the time of planting, and the farmer who has a considerable acreage devoted to hay will find it necessary to utilize all the short cuts in harvesting, stacking and curing, as well as taking the necessary precautions to preserve it until feeding time.

Hay is a bulky crop and requires considerable handling from the time it is cut until stacked, and a great deal of labor can be wasted in harvesting. If an old method can be superseded by a new one that will enable a given crew to accomplish more than before in a given time, then it is a wasteful method and should be abandoned. Where labor is scarce the following efficient methods in hay harvesting will often overcome the labor handicap, for we have found that in industrial matters one skilled American can accomplish more than half a dozen unskilled coolies. Where human labor is cheap and plentiful the inefficient practices might do, but on our American farms every man's brains as well as his brawn must count.

Efficiency in hay making means primarily the utilization of tractor or horse power instead of man power wherever possible, and the use of proper implements has a vital bearing upon the saving of human labor. The time of day when the hay is cut has a considerable effect upon the production and the number of men required. If hay is cut early in the morning when the dew is still on, a crew can accomplish more work than if the mowing was done later in the morning, and if mowing and raking are both done in the afternoon, still less work can be accomplished by a given crew.

The size of the harvesting implement has a direct bearing upon the amount of work which can be done in a day. While the five foot mower is in common use on many farms, if sufficient power is available, especially on tractor farms, it pays to use six or seven, or even eight foot sizes. Under average conditions a five foot mower will cut ten acres in ten hours, a six foot mower will cut 12 acres, a seven foot 14 acres and an eight foot about 16 acres in ten hours. Accordingly a farmer who uses an eight foot mower can cut almost twice as much hay in ten hours as he could with a smaller mower, and he can, therefore, almost double his labor turnover. Where horses are relied on for motive power it might not always be possible to use the larger mowers, but on power farms the tractor will furnish ample power for this work.

It is the practice of some farmers, who can put into the fields at one time more than one mowing outfit, to have them follow each other closely, each machine cutting a swath and followed by the next, and so on. From a study of hay making crews conducted by the government, however, it was found that this is not the best method to pursue and that more can be accomplished by having each mower operate in a given field by itself. In the former practice one machine is paced by another, and if the first stops for any cause the entire outfit must likewise stop, and being close together there is a tendency for the drivers to stop and talk more than they would if widely separated. This tendency was found particularly strong in the South, where darky labor is largely employed, and when the men were given separate patches to cut they accomplished more work.

The use of a tedder for stirring hay in the windrow is one of the most efficient means of saving labor, for where it has been the practice to use human labor for this work it was found that one man, or even a boy, operating a tedder, can turn as much hay in a day as 12 men using the hand method. Horse and machine labor is cheaper than human labor, and if a tedder is not part of the farm equipment its purchase will pay for itself where considerable hay is to be cut and cured.

Reaper and Binder at Work in San Bernardino County

On ranch of J. F. Catlett below Chino, where thousands of acres of immense grain crops are being handled almost entirely with reaper and binder and only a few fields here and there have been cut about margins for combined harvester.

Another great difference in the saving of labor is found to be true in the case of horse drawn rakes. The one horse rake requires the services of a driver just as a larger rake, drawn by two horses, would. An eight foot rake is commonly used with a single horse, while one of 12 or 14 feet will require a good strong team to pull. The latter, however, will cover 50 per cent more ground in a day and do it more easily than the smaller rake. The average farm boy can drive the larger rake oufit as well as a man, for no great strength is required. On very large farms where considerable hay is grown it will be found more economical to use the side delivery rake, for the hay loader can start taking the hay from the windrow as soon as the side delivery rake has made one double windrow across the field, whereas when the sulky rake is used they will have to wait until the rake has gone several times across the field.

Where it is the practice to cure hay in the cock, and weather conditions are apt to be unfavorable, many farmers have found it pays to use hay caps to protect the cocks while curing. This is especially true of alfalfa or other legume hay which cannot be cured in the same manner as timothy or clover. The hay caps protect the cocks from rain, reduce the loss of leaves and improve the color and increase the feeding value of the hay.

Some hay caps which can be bought are made of waterproof material, such as wood pulp, but most of those in use are made of canvas or duck and are made waterproof by treating the material with oil, paraffin or other substitute. Where the treated caps are not available ordinary cloth caps can be made of sheeting, unbleached muslin, twilled cotton, or duck, in sizes varying from 24 inches square to seven feet or more square. A common size for hay caps is from 30 to 36 inches square, which will answer any ordinary requirements. The caps are spread over the cocks and kept from blowing off by weighting the ends down with stones tied to the corners or by using wire pins run into the hay. Caps made from heavy material and carefully stored away when not in use will last for a number of years, some owners getting as high as eight years use from them, while others find they last for four or five.

Where hay caps are used it is the best practice to put them on just as soon as the cock is made. Otherwise a light shower may occur to damage the hay.

While hay caps are used principally to protect curing hay from rains their use is beneficial from other standpoints. Two important processes are involved in the curing of hay—the throwing off of a large per cent of the water in the plant and a heating or sweating process that takes place when hay is put into the cock. This heating, or curing, process is beneficial for it develops aroma and palatability in the hay. When rain wets hay in the cock, however, it stops the natural curing process and causes the hay to heat very rapidly. The hay often becomes so hot that its feeding value is impaired, and sometimes the heat becomes so intense that the hay is ruined. If the caps are put on before the rain comes the hay will be protected.

The quality and grade of hay is largely indicated by its color, and this color is affected by the rain, strong sunshine and other influences. The hay that brings the best price in a commercial market is that which has the best color, and the use of caps has a tendency to preserve a uniform color in the hay cured and prevent the occurrence of patches of off colored hay which often results in grading down a bale of otherwise excellent hay. In the case of alfalfa hay it is found that too much direct sunlight causes alfalfa to bleach and become lighter in color, which is prevented by the use of caps.

In certain sections of the South, particularly in Georgia, Alabama and Mississippi, it has become the custom of hay producers to use trucks for the curing of hay. The use of such trucks enables curing to proceed under unfavorable conditions, for if the ground becomes too wet the loaded trucks can be hauled to a more favorable site or even placed under shelter.

The curing truck is quite similar to the ordinary hayrack except that it is mounted on wheels. It is 12 feet long and seven feet wide and will hold from 1,500 to 2,000 pounds of cured hay, depending on how much the hay is cured when put on the truck. The back is supported by two 16 to 20 inch steel or iron wheels running on an axle placed about four feet from the rear end of an A-shaped frame. When a loaded truck is not in motion, as when left in the field for the hay to cure, the front end is supported by a six by eight inch wooden block of sufficient strength to hold the truck level. This trigger is fastened between the two main frame timbers by a heavy bolt, enough play being left so that it swings easily by its own weight. When not in use the trigger drags lightly on the ground.

The trucks are moved by means of a two horse team and a two wheel running gear similar to the front running gears of a low wheeled wagon.

In order to use the truck successfully hay must be cured to a certain point before it is put on the truck. If not sufficiently cured there is danger that it will heat and spoil. Hay is in best condition to be put on the truck when it has cured enough to go into the cock or possibly just a trifle greener, as it is desired to do the last third or fourth of the curing on the truck. A canvas cover or cap is usually placed on the hay to protect it from the rains.

When hay has been properly cured and is ready for the stack a hay loader will be found more economical and efficient than hand labor. Where a hay loader is used the hard part of the work is done by horses or by the tractor, and a crew using a loader can handle about 30 per cent more hay than when it is pitched on by hand.

ARIZONA CROP OUTLOOK

The wheat crop of Arizona for this season is estimated by L. M. Harrison, state field agent for the United States bureau of crop estimates, at 1,000,000 bushels. His report shows that there are 50,000 acres less for hay production than last year. Fruit conditions throughout the state show an average of nearly 30 per cent of normal. This is due very largely to a backward spring, late frost and some heavy wind storms. Pasture conditions throughout the state are excellent. The acreage of cantaloupes this year is 2,500, as compared with 4,500 last year. The condition of the cotton crop, while only 80 per cent of normal, is better than it was expected to be the first of May. The acreage of long staple cotton for the state, according to the estimates made June 1, is 210,000. There are also 20,000 acres of short staple.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EARTHQUAKE

Los Angeles had a jolt in a light earthquake which visited a portion of the city and was especially manifest at Inglewood, about ten miles southwest of the business portion of the city. Several buildings were damaged, but no loss of life was reported.

OVER FOUR BILLIONS

Secretary Meredith calls attention of American farmers to the fact that their products were exported during 1919 so liberally that their value exceeded $4,250,000,000. This was 55 per cent of the exports of the United States. Congress denied, or rather refused to grant, to the farmers the privilege of cooperating in marketing their farm products. The Capper-Hersman bill should have been passed. Farmers will continue to cooperate, however, and it is very probable Washington will continue to harrass those who are engaged in true cooperative effort. In any case the agricultural exports for 1920 can hardly be equal to those of 1919.

INDEX

A hasty glance at the index on Pages 1034 and 1035 will give information as to the great amount of reading material which has been given to subscribers of the California Cultivator during the past six months. As it is there are hundreds of articles which are not mentioned on those index pages. This has been the Cultivator's greatest year. It has been one of farming's greatest years though in animal husbandry and in some other agricultural activities conditions might have been better. File the Cultivators with the index and file other lessons of this great year that the next and other years to come will be still greater in California farming.

RESTRICT JAPANESE

The governor of California and his commission investigating the Japanese situation in the state have finally spoken. The tone of the governor's letter is such that every well wisher of the state cannot help but be encouraged that the campaign of education as to California's menace will now result in action. The governor calls attention to the fact that the unfortunate attitude of many Americans maintained during the Chinese exclusion agitation of years ago has not been repeated as to the Japanese. As a rule the attitude of the American has been that of securing fullest information as to the real menace.

The Cultivator will quote from the governor's letter to the secretary of state in its next issue and also from personal letter just received from Senator Phelan.

VALUABLE BULLETIN

The Monthly Bulletin of the state department of agriculture is well worth a place in the library of every orchardist. It is now in Volume IX of which Numbers 5 and 6 are issued for the months of May and June. Looking back over the past three or four numbers we are impressed with the value of the material which is being gathered in these bulletins. Besides the news regarding the work of the department, especially that division of it pertaining to standardization, there are special articles of particular merit. The issue for March dealt with standardization in an extended article written by Director Hecke. This number was so complete that a supplement was necessary, containing the proceedings of the Fruit Dehydration Convention at San Jose. The April number gathered together between its two covers the most complete information yet issued on "Biological Control of Mealy Bugs in California," by Harry Smith and H. L. Armitage. The frontispiece is a colored plate, and there are many most informing halftones and drawings. The double, May-June, number pays tribute to George E. Merrill, with valuable articles on Walnut Blight, Sorghums on Rice Land, Fig Cuttings, Grasshopper Poison, etc.

BUILD THE ROADS

Some think the good roads campaign should stop. The bonds were voted almost unanimously by the people of the state but since the election the price of money has vastly increased. No one wants state bonds at par when the interest is far below Libertys and other bonds which now may be bought on the market. It is proposed that an election shall be called to put another one per cent on the interest. Some object to this and think the entire campaign should be called off. Writing to one of these, Governor Stephens says:

"There is constantly present in my mind the unprecedented majority vote cast by the people only last July for highway construction. With my abiding faith in our people and a devotion to the laws of the state, I shall welcome an initiative petition to the end that all the people of California shall determine for themselves the question of increased interest rate on their own bonds and by the same vote determine the matter of further construction.

"The people in the exercise of their initiative rights have made no serious errors. It matters little how much you may dislike the initiative or any particular decision that the people may make, but it does matter much that in this free government of ours, founded on laws and principles, and not men, that neither you nor I shall presume to dictate to our people nor take unto ourselves too much the function of determining for them."

TOMMY" LEAVES

After July first Professor J. I. Thompson, familiarly known as "Tommy," will no longer be connected with the animal husbandry department of the college of agriculture, University of California. That he will be missed goes without saying and that he will leave with the whole hearted good wishes of the livestock fraternity he has served so well is equally certain. Thompson came to the college of agriculture shortly after his graduation from the Iowa state agricultural college. His delightful personality and his sound knowledge of the livestock industry almost immediately won him the friendship of all who came to know him. In the nearly ten years that he was associated with the institution he filled many responsible positions and always with credit. Thompson undertook the first real swine investigations made in this state and the many feeding trials that he conducted have been of gerat value. He was instrumental in organizing a number of the existing livestock associations and his services at the leading fairs were always in demand. As a teacher he at all times enjoyed the confidence of his students and there are many successful livestock men in this state today who freely give credit to "Tommy" for the success that has been theirs.

It will not be easy to fill his vacant chair, but we take it that the institution will make every effort to attract a man fitted to carry on the good work that has been started. It seems a great pity that state institutions are so cramped for funds that they are unable to compete with private enterprise in holding their men. In this respect the University of California is no different from other institutions.

STILL 650,000

The U. S. civil service commission feels that it is not understood because it has been criticized for the fact that while the war is over (nearly), the commission is still seeking applicants for examinations. The commission says that on April 1, 1917, there were about 500,000 persons employed in the federal executive civil service. This increased to 850,000 at the time of signing the armistice. Excepting in the eyes of politicians who have desired to make capital out of an unfortunate situation, the war has been ended nearly two years, but in two years these civil service employes have been reduced to 650,000.

Of course, we are nearly 3,000 miles from Washington, and vision is poor at that distance, but why these years of time necessary to reduce the force to normal? As to the renewal of the force, "the natural turnover in a force so large requires some appointments to fill vacancies." Notwithstanding our distance from Washington, we are able to see and feel the two cent stamp which we pay for on every bottle of hair restorer, and there is an occasional soda and a few other things that remind us that income tax time will soon come also.

We realize that there are a lot of fine jobs up at Washington and naturally there will be great reluctance by various commissions and things to loosen their hold on these jobs, but the whole country is sending up a wail and it is to be hoped that a bit of relief may be given to us, and soon.

FEDERAL FARM LOAN

Before the federal farm loan is given a fair trial it seems to be slated for the toboggan. The National Board of Farm Organizations reports:

"The federal farm loan act is in jeopardy. From the outside the Farm Mortgage Bankers Association is attacking it on the ground of unconstitutionality and from the inside Judge Lobdell, commissioner of the board, is opposing its cooperative features. Moreover, Secretary of the Treasury Houston, chairman ex-officio of the board, is responsible for reducing the amount of loans which otherwise would have been available for farmers this year, pending the decision of the supreme court of the United States, by the sum of approximately $32,000,000. To cap the climax the federal farm loan board this week took measures to dispense with the services of its secretary, W. W. Flannagan, who, by many congressmen and others familiar with the facts, is regarded as the father of the present farm loan act."

Possibly we look with prejudice on this matter, but it does appear that Washington is not extending as much encouragement to agriculture as it is to large commercial interests.

A review of the federal farm loan situation reveals the following:

In July, 1919, representatives of the farm mortgage banks brought suit in the federal court at Kansas City challenging the validity of the act. The court dismissed the complaint and sustained the constitutionality of the act October 31.

The case was appealed to the supreme court of the United States and heard January 6. On April 26 the supreme court ordered a reargument of the case to be taken some time during its next term in October.

The federal farm loan board has offered no bonds for sale since the litigation was begun and does not intend to offer any for sale while the litigation is pending.

Mr. Platt, chairman of the banking and currency committee of the house, introduced a resolution which would have given the secretary of the treasury authority to purchase farm loan bonds to the amount of $64,000,000, this sum being the amount available to the secretary of the treasury from the $200,000,000 appropriation provided by congress January 18, 1918, at the request of Secretary of the Treasury McAdoo, to be used for the purchase of farm loan bonds in order to avoid having these bonds on the investment market in opposition with liberty bonds. Of this $200,000,000 about $136,000,000 had been used in the purchase of bonds, leaving a balance of $64,000,000.

The federal farm loan board through Commissioner Lobdell took the same position as the secretary of the treasury.

The banking and currency committee amended its original resolution and limited the authority to sell bonds in an amount only sufficient to cover loans approved prior to March 1, 1920—round numbers, $32,000,000.

The federal farm loan board on June 2 adopted a resolution providing that the office of secretary of the board, held by W. W. Flannagan, be declared vacant, and for the removal of clerks and stenographers and other assistants to the number of 16.

California Avocado Orchards

By Ernest Braunton

THE total acreage of avocados in California will run pretty close to 1,000, chiefly located in the south end of the state, with some acres in Central California, and collections of a few trees as far north as Butte County. Each year marks a considerable extension of avocado planting and the precise present acreage cannot be accurately determined.

Representatives of the Cultivator have begun a tour of the larger orchards and will from time to time advise our readers of what is taking place therein. No one has a more interesting or larger orchard than W. A. Spinks, Duarte, Los Angeles County, numbering more than 1,800 trees. The varieties and numbers are approximately as follows: Spinks, 700; Queen, 400; Knight, 200; Linda, 200; the remainder, 200 or more, some young mango trees were blooming and had already set hundreds of fruits, at present about the size of garden peas. Cherimoyas were still in fruit, though some of them dropped their last fruit months ago. It is quite evident that by selection of varieties we may have cherimoyas, as well as avocados and oranges, each month in the year.

Carissa grandiflora was laden with both blossom and fruit, as it is at all times, though the fruit crop is generally sparse. Eugenia Jambos, the rose apple, was in full bloom, the flowers closely resembling gigantic eucalypt blossoms, for both trees belong to the myrtle family. Eugenia Hookeriana, said to be the best of the many species, was in vigorous growth close by, as were the African kei apple and many other fruit trees. Macadamia ternifolia, the Queensland or Australian nut, was dropping its delicious

The Spinks Avocado and Its Discoverer

W. A. Spinks standing by a "Spinks" tree. The Spinks is one of the five recommended by the committee of the state association.

named and others unbudded seedlings. Among the latter are some very promising fruits which may yet find their way into the official preferred list.

Mr. Spinks is firmly convinced of the excellence of the new Guatemalans introduced by E. E. Knight, the Queen, Knight, and Linda, and his later plantings have been heavily of these varieties. Of course, the largest number is of the Spinks. The latter name is now officially attached to this excellent avocado, though Mr. Spinks claims no credit for its introduction, did not name it, and says others were doubtless growing budded trees of it before he was. But he introduced it and distributed buds and budded trees, and by the laws of custom and by general consent it became known as "the Spinks variety." In this orchard, in early days of avocado budding, budwood was tried from every possible source. Mr. Spinks says he is fully satisfied the buds of Spinks came from the Bradbury ranch immediately below his, but the fruits are larger and finer on his trees, possibly due to bud variation.

Other Tropical Fruits

On other parts of this interesting ranch are so many tropic and subtropic fruits that the precise number of species and varieties could not be ascertained. A half dozen vigorous hard shelled fruits, and close at hand the Chinese litchi nut (pronounced li-chee) was in full bloom. Even cinnamon trees and others of commercial value were growing, some of great size and vigor, on this attractive, frostless foothill ranch, but lack of space forbids a complete list. No tea or coffee plants were noticed; it was fruit, fruit, everywhere but not a drop to drink.

After thorough canvass of the Spinks ranch the Cultivator representative visited Thos. H. Shedden at "Florimel Ranch" just above Monrovia, on one of those frostless benches for which this district is noted. Here we found mangoes, cherimoyas, sapotes, etc., and some 400 avocados in "57 varieties." These may range to 60 but Mr. Shedden says all but the standard recognized sorts will be top worked until the whole 400 is reduced to about a dozen of the best. Having some years ago retired from the hotel business in San Francisco, Mr. Shedden has some interesting price comparisons to make. San Francisco dealers in avocados from whom he formerly purchased imported fruits at four or five dollars a dozen now write to ask if he can procure them California avovados at $12 a dozen and as much as $15 a dozen has been offered. Wherefore Mr. Shedden says: "The demand for avocados is increasing and is more persistent, or insistent, each year."

Brown Rot

By A. T. King in Sunsweet Standard

BROWN rot is most prevalent in low places where the orchard is situated on the heavier soils. This fact gave rise to the belief that frost was the real cause. Some still persist in referring to it as "sour sap." In some northern districts they have dubbed it "twig blight." But the name matters not. The twigs die in the midst of their most hopeful career and take with them every little blossom they hold.

Since its first appearance this disease was claimed by those studying it under the microscope to be due to a fungus and was therefore to be fought with a fungicide spray. It remained only to be decided what was the proper time to most effectively apply that spray.

From the university experiment station comes the following recommendation:

Lime Sulphur Mixture

First spraying, 1 to 10, when buds are swelling.

Second spraying, 1 to 10, when buds show pink.

Third spraying, 1 to 30, when fruit is in the jacket before leaves show.

The following results of spraying according to above recommendations may be helpful.

I have four acres of Blenheim 'cots situated in low, heavy ground, especially susceptible to fungus disease. No indication of disease prior to 1915.

In 1915 crop was normal. Some brown rot in fruit after period of ripening. Yield, 35 tons.

In 1916 rain while fruit was in the jacket. Young fruit immediately rotted and fell. Yield, 12 tons.

In 1917 cold winter. Fungus disease attacked fruit spurs, killing practically all spurs and reducing crop to one and one-half tons. Expense of pruning trees tripled owing to necessity for cutting out all dead wood.

In 1918 very dry winter. Trees shy of fruit wood. Sprayed with oil. No trace of disease anywhere in the valley. Yield, six tons. Fruit clean.

In 1919 trees full of new fruit spurs. Blossom excellent. Enter brown rot fungus. Exit all young fruit wood with $2,000 worth of fruit.

I sprayed as disease was progressing. Lime-sulphur (summer strength). Fifteen tons. Fruit free from rot. Pruning bill double owing to presence of dead wood.

In 1920 season favorable for development of disease. Sprayed in January for brown apricot scale. Distillate emulsion. (Spray ineffective.)

Sprayed later three times with lime-sulphur, following instructions of county horticulturist. Brown rot to this date almost entirely absent. Crop light, owing principally to absence of wood caused by disease in 1919. Adjacent orchard, situated in same low, heavy ground, is hard hit by disease, losing 60 per cent of the fruit wood, together with its fruit.

Summing up, I will say that if one ton of fruit has been saved the three applications of spray have been paid for, and if the wood has been saved the spray has been paid for many times over.

During the period from 1916 to 1920, inclusive, the orchard mentioned should have produced in the neighborhood of 150 tons, but because of this disease that takes two crops at a shot the total production during that period will not exceed 50 tons. How many times could one spray four acres for the price of 100 tons of 'cots?

There are other orchards in the valley whose owners have sprayed with lime-sulphur, and the results have been even more apparent than in the case described. Some growers use Bordeaux, and where this spray was applied at the proper time the results are very clear. One mentions spraying all but a center row, leaving that as a check. His one row unsprayed was the only row badly hurt by the disease. That indicates something.

Oil sprays seem also to have checked the disease in many cases, but the most apparent results seem to follow the use of a recognized fungicide spray, lime-sulphur preferred.

These facts should be remembered. It costs less to spray than to cut out half the fruit spurs. Loss of spurs reduces the crop for two years. Brown rot is apparently becoming more and more prevalent in the state and should be checked by every possible precaution.

IN HARVESTING ALFALFA SAVE THE LEAVES

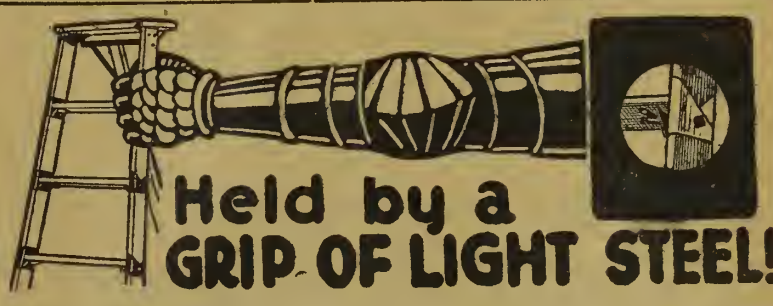
In curing alfalfa for hay it is particularly important to save the leaves. Whether this is done depends on the method of curing; the methods of curing depend chiefly on the man who is doing it. If he understands the great value of the leaves, he usually succeeds in doing so, because here is one place where "too rushed for time" has no part. It is as easy and as rapid to cure alfalfa properly as to lose most of the leaves.

The leaves are considerably richer in protein and mineral matter and about four times as rich in fat as the stems. Cattle and hogs eat leaves as well in properly cured hay. Moreover, the leaves represent from one-third to one-half the total dry weight. With hay at its present high price no farmer can afford to lose from 30 to 45 per cent by curing improperly. That is just what happens when the leaves are sacrificed.

Most leaves—practically all of them, in fact—may be saved by cutting at the time the first blossoms begin to show and by curing principally in the cock. Early mowing (one-tenth bloom) gives a considerably larger seasonal yield for the three cuttings than does later mowing. The hay is more palatable and also more nutritious. This is shown by the fact that acre yields were in the proportion of 100, 92 and 85 for early, medium and later cut hay. The yields of beef were 100, 79½ and 69½ respectively for early, late and medium cutting. These are average figures for the total of each season for five years.

Quality in the hay is further exchanged by raking at once and cocking as soon as possible, preferably the same day it is cut. Possibly some alfalfa land is too wet to permit this, but not much of it, and that little is not good alfalfa land. Let the hay be cocked as green as possible in small cocks just large enough to make one good forkful. Alfalfa so cured retains its leaves, is bright in color and palatable. Furthermore, it is easer to handle both in loading and unloading. Firmer and more symmetrical stacks can also be built from the compact flakes made by the cock curing. Such hay also sheds water better than swath cured hay, which consists mainly of stems and which is invariably too loose and too dry to handle well.

Alfalfa leaves are valuable. They increase the total yield by about 30 to 45 per cent. They are also better feed, pound for pound, than the bare stems.



Held by a GRIP OF LIGHT STEEL!

Light weight—yet STRONG! There's the secret of Security success. Although built of light materials (Douglas Fir used exclusively) the superior construction of the

SECURITY KANT-WOBBLE LADDER

makes it the ONE ladder that positively CANNOT WOBBLE—only the SECURITY has the light steel grip that prevents wobble. The ladder that every up-to-date orchardist is using—the ladder that actually cuts picking costs. Let me ship you two or more Security Ladders on approval NOW—I prepay the freight—if not entirely satisfied with ladders. send them back, and you will be out nothing.

PRICES:

6-FT., $4.50; 8-FT., $5.80; 10-FT., $7.00

Ask your dealer about Security Ladders. Dealers in 114 Coast towns handle the Security. For name of your dealer, see California Cultivator of June 5, Page 915

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer covercrop.
Maintain a moist surface mulch.
Will prevent June drop.
Require less irrigation than other crops.
Need no irrigation where soil moisture has been conserved.
Build up poor soils with more nitrogen bacteria and humus than any other covercrop.
Afford the best kind of pasture for cattle and hogs.
As a hay have a food value of 43% more than Alfalfa.
Will improve your silage.
There is no better Bee Pasture.
Thirty pounds of seed is sufficient to plant one acre.
Our seed germinated 96%.

Bud Variation in Lisbon Lemons

Shamel has a new bulletin out. It is U. S. D. A. Bulletin 815, "Citrus Fruit Improvement, a Study of Bud Variation in the Lisbon Lemon." It is by Shamel, Scott, Pomeroy and Dyer. We note: "Additional copies of this bulletin may be procured from the superintendent of documents, government printing office, Washington, D. C., 25 cents.

Summary

The important commercial lemon varieties now grown in California are the Eureka and Lisbon. The Lisbon variety was introduced from Australia about 1874, and later in 1875, with perhaps less important later introductions.

Several important strains of these varieties have resulted through the unintentional propagation of bud variations. In this bulletin only the variations within the Lisbon variety are discussed. Descriptions of variations in the Eureka variety will be found in United States Department of Agriculture Bulletin No. 813.

Bud variations are of frequent occurrence in some of the trees of the Lisbon variety. Some of the strains which have developed from them are inferior in quality and quantity of fruit and mature the fruits at seasons when there is no great market demand for them. These strains occur as variations in the habit of tree growth, in characteristics of the foliage and blossom, and in the color, shape, texture, juiciness and other characteristics of the fruit.

The object of these investigations has been to determine the behavior of trees of the different strains and of the individual tree variations within the strain, to prevent the propagation of inferior strains, to develop practical methods for eliminating undesirable trees in established orchards, and to isolate and propagate the desirable strains and superior trees within these strains through bud selection based on individual tree performance records and intimate tree knowledge.

The plan of work as followed in these investigations has been to secure individual tree performance records in carefully selected plats of the Lisbon variety. Each tree is picked separately, the fruits assorted, counted, weighed, detailed notes taken, and other data obtained, so that after a series of years definite conclusions concerning strains and individual tree behavior can be drawn.

In these investigations five strains of the Lisbon lemon have been studied, their characteristics described, and the performance records of individual trees recorded.

Some of the lessons taught by these studies include the discovery of the importance of bud variations, the comparative value of the different strains arising from them, the need of eliminating the unprofitable strains and isolating the valuable ones through bud selection, and the origination and introduction of improved methods of propagation for conserving and improving the production of the Lisbon lemon variety. The desirable strains can be isolated by means of careful bud selection based on individual tree performance records and intimate tree knowledge.

Undesirable healthy trees or inherently unproductive ones in established orchards usually can be successfully top worked by using select fruit bearing bud wood from performance record trees.

Undesirable unhealthy trees in old established orchards can be replaced with desirable younger trees which have been propagated from selected fruit wood, provided proper attention is given to the preparation of the planting hole and, later, to care in irrigation and fertilization.

Only fruit bearing bud wood from superior parent trees which have been selected on the basis of their performance records and from intimate tree knowledge should be used for propagation or for top working.

The California Fruit Growers' Exchange, a cooperative organization of 8,000 citrus growers, has established a bud supply department as a result of these investigations. This department furnishes at cost to growers and nurserymen bud wood from superior performance record trees.

SALE OF SCRIP AT SACRAMENTO

Surveyor General W. S. Kingsbury will hold a public auction sale of scrip in the senate chamber at the state capitol, Sacramento, on Tuesday, July 6, 1920, at 10 a. m.

State scrip is the cheapest land scrip on the market today. It can only be purchased by citizens of the United States who are residents of California and can be located on any vacant nonmineral government land in California. State scrip is not transferable. No purchaser can buy more than 640 acres of scrip. It is sold in 40 acre lots for cash, personal checks received, and the surrender of the scrip is payment for an equal acreage of government land. At the last auction sale the prices received averaged approximately $8 per acre.

Homestead and desert land entrymen can relinquish their entries through the suveyor general and acquire title to the land through the purchase of scrip. The applicant need not live on or improve the land.

GRAPE GROWERS FIX PRICES

The California Grape Growers Exchange has adopted the following schedule of prices:

Burger grapes, $50 a ton; other white varieties, $60 a ton.

Zinfandel, Mataro, Burgundy, Mission, Carignane, etc., $65 per ton.

Alicante, Petit Bouschet, Grand Noir, Petit Syrah and other heavy color grapes, $70 per ton.

Alicante and heavy color grapes will be sold for $70 per ton when matured, regardless of sugar content. All other grapes will be sold on a minimum sugar content basis of 20 per cent. If it is less, the price will be reduced at the rate of $1 per ton per degree of sugar deficiency.

CALIFORNIA GRAPE INDUSTRY REPORT TO BE ISSUED

A complete survey of the California grape industry for 1919, with a forecast of crop and conditions for 1920, will be issued during the month, says Director Hecke of the California department of agriculture. This bulletin will constitute the first report to the director of agriculture by R. L. Nougaret, in charge of the office of viticulture of the department, and will cover all phases of the grape industry—production, prices, by-products and marketing. Copies will be sent upon application to Director of Agriculture, Sacramento.

VENTURA'S SIXTH ANNUAL FAIR

The Ventura County Fair Association announces its dates as September 22-25, 1920. L. P. Hathaway, secretary, is mailing out the premium list covering rules and regulations of officers and directors, and general information regarding the fair; also a complete list of the premiums, with prizes offered to grooms of best kept stalls and other prizes. The first paragraph under rules and regulations is "Competition open to exhibitors from all parts of the world."

NURSERYMEN TO REGISTER

All nurserymen or persons who sell or handle nursery stock, trees, or plants for propagation in California are required to register annually with the state department of agriculture The registration fee of one dollar for license for the fiscal year 1920-21 is due July 1, 1920. The liceuse number must be placed on all shipments of nursery stock. Notices to all nurserymen registered during the past year are now being sent out.

Lemon Pruning Demonstration

By Ernest Braunton

FARM Adviser Hodgson and Assistant Adviser Blanchard performed some pruning operations on lemon trees at the Emory ranch near Whittier, Los Angeles County, that constituted a revelation to nearly all the lemon growers present, this being the third pruning given these trees by them. It was nothing more nor less than the long or Whitten method with deciduous trees, applied to lemon trees with but slight modification. Before repairing to the orchard Mr. Hodgson delivered a very instructive and interesting talk from which we culled the following:

"Citrus growers were never so at variance on the subject of pruning as at present. There is no general agreement as to the best method or methods. The range of practice is from vigorous or heavy pruning down to no pruning. We have still a limited knowledge of the requirements of citrus trees, for we have had them with us less than 50 years—not two full generations—and only the last generation has investigated. Deciduous fruits we have cultivated for more than 250 years, yet only of late have we been able to get down to a practical solution of the pruning problem.

With our previous knowledge and experience with deciduous trees we have been applying the practices of our forefathers to an evergreen fruit tree, with varying success. We have been told that summer pruning of the lemon was invigorating because when we cut away heavily the response in new growth was heavy. But this was nature's response to a natural demand—the tree attempted to replace the leaf growth of which we denuded it. Severe pruning is divitalizing because we rob the tree of a "food factory hand" with every leaf we take away during the active season. We should avoid pruning as much as possible.

Citrus Trees Tropical

"The orange tree is native to the tropics. Here conditions are quite different. We live in a country naturally semi-arid, almost a desert. June drop of citrus fruits is largely due to climatic differences. Again, citrus trees are the most unstable in type of any fruit trees we grow. The Washington Navel has broken up into at least a dozen well marked types, many of which have been given commercial names. At the Riverside experiment station there are about 20 distinct variations. So that orchards are of necessity variable in the tree types they contain. They are not like an orchard of Baldwin apples where every tree and the fruits on nearly every tree are remarkably of one type.

"Some citrus trees are variable in much the same way as other plants. The cotton plant, for example, has two types of growth, and oranges and lemons often have both vegetative and fruiting wood. Some have not, or, if present, it is to a varying extent. Therefore all trees cannot be pruned alike and good judgment is necessary to render justice to all trees. Two types of wood and leaves are often present. Leaves on one set do not pay for their 'keep'—they are practically parasitic; the other set has to make up the deficiency, build the tree and produce the crops. Much sucker growth in a tree is devitalizing. One pruner will cut out useless wood, both that too young and that too old, and the tree is greatly benefited. Another will cut out an equal amount of wood and work a positive injury to the tree.

Why We Prune

"Why prune citrus trees at all, is a question asked by many. Some pruning is necessary and for three good reasons: 1. Because otherwise the tree would grow too large and the expense of picking, spraying and fumigating prove too great for commercial success. 2. Trees become too dense and air and light must be admitted to the interior. Locally the Washington Navel grows both large and dense, but at Bakersfield it is dwarfed, very dense and of a black green foliage. 3. If not restricted, undesirable types of non-bearing wood dominate some trees. This must be reduced and bearing wood induced to fill its place. These three reasons are sufficient to justify some pruning.

"Trees grown from fruit buds are small, eccentric in growth, but bear early, regularly, and indefinitely. Over 40 years harvests are known. Trees from sucker buds make large, vigorous trees, come into bearing late, often at eight or nine years of age, but are weak constitutionally, bear 12 or 15 years and then deteriorate in all ways. There is also an intermediate type or types, consisting of both sucker and bearing wood. The former must be cut away and the latter encouraged so that this type of trees may be controlled and 'brought back' to fruitfulness. Avoid severe pruning, heading back or stubbing at all times. Light and careful pruning gives maximum results with a minimum of labor and is productive of early and heavy yield of fruit."

The New Method of Pruning

Farm Adviser Hodgson and Assistant Adviser Blanchard pruning a lemon tree, for the third time, in the Emory orchard at Whittier, staging a "come back" with trees formerly unproductive.

PLANTING CITRUS TREES

On June 8 bare root citrus trees were being planted on the C. C. Chapman ranch, Fullerton. When the holes were dug—and they were large,—the refilling was done by mixing with the soil 20 per cent of what is called "vegetable humus" from the lowlands about San Bernardino. It is claimed to be from decomposed sweet clover, smart weeds, sunflowers, etc., and to contain considerably more than one per cent of nitrogen. It costs about $9 a ton. It is evidently high in humus content. This ranch is now paying $13 a ton for a high grade dairy manure.

NEW BULLETIN

Department Bulletin No. 312, "The Clover and Alfalfa Seed Chalcis Fly," by T. D. Urbahns, has just been issued by the United States department of agriculture. Mr. Urbahns, who is now assistant entomologist with the state department of agriculture, prepared the bulletin while with the bureau of entomology. The investigational work was done in the alfalfa seed districts of California, Arizona and Utah.

Leader *waterfys* your farm for a lifetime

Buy the water supply system for your home and farm just as you do your farm machinery. Be sure to get the system that delivers water as unfailingly as a city water supply system. Such a system will save you time, labor and money.

Leader

One of the Leader Home Water Systems. There is a Leader outfit to meet the requirements of every home and farm.

Home Water Systems—Leaders in fame as well as in name

We have investigated all home water supply systems but have never found anything to equal the Leader in reliability and year-in-and-year-out economy. It is the only home water system made complete in one great factory and to insure reliability is equipped with the world's standard power—Wagner Motors or Stover Good Gasoline Engines.

The installation is tested as a complete unit instead of a piece-meal job. See the Leader dealer in your locality today. If you don't know him, write us.

HEDGES-ATKINS SUP. CO.,
DENVER, COLO.

Established 1903 — Leader — Tanks, Pumps and Power Equipment

Every drop power-full

"Red Crown" is all-refinery gasoline—with full power in every drop. It is made to meet the requirements of your engine. Look for the "Red Crown" sign before you fill.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Rattlesnake Oil

Having seen the query in Cultivator as to rattlesnake oil, will say my father lived in Illinois when I was a child. Rattlesnakes were somewhat plentiful in those days. When he was working in the field he always wore old fashioned leather boots and whenever he saw a rattlesnake lying in a position so he could slip up and put his foot on its head and hold it down till he could take out his pocketknife and cut off its head, he would do so, removing it away from the head so as to keep it free from the poison. Then he would cut it open along its stomach; the fat would lie in rolls on each side, which he would take out and render out the same as any other fat or oil. We always had it in the house to use in the family. Never knew him to sell it. If the snake is disturbed it is liable to bite itself, rendering the oil poisonous and unfit for use.

May Be "Little Leaf"

Can you tell me what is the trouble with my peach trees? I enclose a few leaves. The orchard was sprayed last fall with Bordeaux mixture and just as they were coming into bloom this spring, with lime-sulphur. Now the leaves and tips are turning yellow and fruit is falling off. Trees are growing in sandy loam.—Subscriber, Sanger.

There is nothing seriously the matter with the peach leaves as to insects and only a trace of shothole fungus, but not enough to affect tree or fruit crop. The leaves are small, thin and papery and prematurely ripening. Quite probably it is "Little Leaf," or some constitutional trouble. We would judge the trouble to be due to growth conditions last fall. A peach tree which suffers severely for water in the fall when it should be plumping up its buds, filling them with reserve material for the next season's strong growth, is sure to throw poor little starved looking leaves, which fail to function, and the starved tree dies or at least becomes non-productive. Maintain good soil conditions in late summer or early fall. We believe there is no help for such a tree at this time of the year.

Dodder

I have a fine field of young alfalfa that has a yellow vine growing in spots through it. Is this injurious and is there any way of eradicating it without destroying the alfalfa?—Subscriber, Turlock.

This is dodder, or love vine, one of the worse pests of alfalfa, and it will prove to be most persistent. The foothill underbrush is so completely covered in some sections this year that at a distance the hillsides have a deep orange color. From these hills the seed wash into the streams and are carried in the irrigation water into the fields. Fire is about the only remedy. Straw or other light burning material may be thrown on the infested spot in the alfalfa field and then burned, and if the dodder has not been allowed to ripen its seed for a considerable time the one burning may be sufficient. If, however, the ripened seed have been allowed to drop over the soil, spots may reappear, when reburning will be necessary. Some have used a large blow torch, same as used by plumbers, to destroy this pest. This is satisfactory and in the hands of careful workers would destroy less of the alfalfa plants than the larger fire made by burning straw. If the alfalfa is killed reseeding is necessary.

Ivy Mallow

Please name enclosed plant, which threatens to become a pest. Please give me information regarding killing same.—B. S., Dinuba.

This is a low growing ivy-like perennial mallow with a light yellow blossom, the whole of leaves and stems being rough and ashy white. It is a common weed over all the state but seldom a serious pest. There is no way to get rid of it before fall plowing, in fields, except to chop it out with hoe. It appears in stubblefields but is never a pest. On waste land it must be handled as any common weed.

Diseased Rabbit Liver

Would like to know what is the matter with my rabbits. They look and eat well, but when I opened some their livers were covered with white spots, like ulcers. They are fed hay and grain and there is always plenty of water and salt before them. They are kept clean.—Subscriber, Patterson.

We believe a little lighter feed, less of grain and more of green would correct this condition. Townsend's "Practical Rabbit Keeping" says: "With correct feeding and green food, particularly dandelion, rabbits rarely suffer from liver complaints. Should the liver become diseased or chronic inflammation set in, the patient had better be destroyed and thus put out of its misery, as the chances of permanent cure are exceedingly remote."

Broom Corn Seed

What is the value of broom corn seed as a feed?—Subscriber, New Mexico.

Analysis shows broom corn seed to contain of crude protein 8.3 per cent, of carbohydrates 62.9 per cent, of fat 2.6 per cent. This is practically the same as milo, which is slightly lower in feeding value than Indian corn or maize.

Tomato Blight

Our tomato plants were set out on the 20th of March, in a sandy loam soil that had never before been cultivated, and while the vines have grown rapidly, with immense branches and leaves, and are loaded with flowers and buds, the first flowers that came died on the vines with the little fruit almost formed. Can anything be done now to insure a crop of tomatoes on these vines? They have been sprayed several times with Bordeux, and a cupful poured around the roots of each plant when they were about three weeks or a month old, as at that time some of the plants were, and are still, infested with blight, though they are fully as large as the other vines. They have been irrigated about three times since they were planted. Do you know what causes this trouble and how it can be prevented?—Subscriber, Del Mar.

This matter of tomato blight is rather a long question. If these plants are affected with true summer blight and already show the wilt it is almost a hopeless case. If the plants had been blight free and on new ground, as suggested by our inquirer, they should show none of this summer blight. Stanley S. Rogers says in Bulletin 239 of our state university: "No remedy can be recommended for the plants showing wilt. When a field has become affected by wilt diseased plants can be seen scattered here and there, the number increasing generally until a large part of the crop has been ruined. In other fields the disease makes very slow progress, affecting only a few plants throughout the entire season. When a plant becomes diseased its condition has no effect on others. A diseased plant is oftentimes surrounded by perfectly healthy vines, and in many cases large tomato fields contain only one plant which has been affected by wilt. Our experiments have proved that the occurrence or the amount of wilt is not influenced by rotation of crops, character of the soil, amount of soil moisture, preparation of the soil or care of the plants in the seed bed or in the field. There is a close relation between the appearance of this disease and the season of planting. Plants which are set in the fields during early spring are much more liable to become affected than those which are planted after the middle of June. The date of the first appearance of the wilt is dependent to a large extent upon the temperature. It generally begins to appear soon after the first hot weather of the spring. It has been recommended, however, that plants put in the ground after June have greater resistance and are more liable to escape."

The dropping of blossoms is not due to blight so much as to cool season. Besides you may be irrigating too much.

Cockroaches

Describe the best method of getting rid of cockroaches. — Subscriber, Bakersfield.

Comstock in his "Manual for the Study of Insects" says: "Thorough and frequent dusting with insect powder in the cracks about the kitchen will rid a house of this pest. After everyone is in bed at night and all is quiet in the kitchen where there are water pipes, often a throng of little creatures come forth from hiding places and, like brownies, take possession of everything. They race around everywhere, trying to find something to eat; they do not care much whether it is raw or cooked, but will devour almost anything that comes in reach of their greedy jaws. They eat book bindings and bedbugs, if they find them, with equal alacrity; and sometimes they get bold enough to appear in broad daylight. The little, pale brown rascal called the Croton bug, which came to us from Europe and infests the vicinity of the pipes, is especially bold and impudent. In fact, in the North our native cockroaches are mostly respectable, well behaved insects, living in fields and forests under sticks and stones, the emigrant cockroaches being the offenders. Many cockroaches are wingless. The eggs of a cockroach are laid, all at once, enclosed in a sort of pod which is more or less bean shaped."

Whitewash

How can I make whitewash which will stick to a building and not scale off?—Subscriber, Oxnard.

Ordinary whitewash to which has been added a strong salt solution makes fine wash for fences or old outbuildings. Another formula said to be exceptionally fine is: For a

tub of whitewash secure a half dozen cactus leaves, cut or chop into bits or thin slices, cover with water and allow to stand for a few days. Use this cactus solution to dilute the milk of lime after it has been slaked. The addition of, say, five or ten pounds of salt dissolved also aids in hardening whitewash. Another is: Slake fresh quicklime in water and thin it to a paste or paint with skim milk. The addition of two or three handfuls of salt to a pail of the wash is beneficial.

Ants in Strawberry Patch

Would you please let me know through your columns what a person can do to kill ants that are destroying strawberry plants and dahlia tubers. The ants eat the roots of the plants and I am worried for fear they will kill all of them. They are the small ant.—Subscriber, Ceres.

Presumably this is the Argentine ant. In any case the method of controlling the Argentine, which has been given several times in former Cultivators, will be surest of securing effective results. First, find the hole or the headquarters of the colony, pour in a liberal supply of gasoline or carbon bisulphide, then make the poison syrup as follows: 12 pounds granulated sugar, 7 pints water, ¼ ounce tartaric acid (crystallized). Boil 30 minutes. Allow to cool. Add water equal to that evaporated. Three-quarters ounce sodium arsenate (chemically pure only), dissolved in one pint hot water. Add poison solution to syrup and stir well. Add to the poisoned syrup 2 pounds honey. Mix thoroughly. This may be put in any container such as small tin can with sponge or cloth saturated so as to permit ants to travel over and secure their fill. In a very few days less of the colony will be observable or perhaps the ants will have disappeared entirely.

Old People's Home

Is there an undenominational home for old people in Southern California? If so, where and what are the requirements to enter: what age; amount of money required? Can the helpless or partially helpless obtain a home there? Who has charge of these homes?—A Reader, Rockwood.

The names of two of these homes are Hollenbeck Home in Los Angeles and Frederika Home at Chula Vista near San Diego. We do not know as to the one at Chula Vista, but one may write to the home there and secure information as to possibilities of entrance. The Hollenbeck Home in Los Angeles now has a waiting list which will require one to two years to exhaust. Its requirements are that the person making application for entrance shall have lived in Southern California three years prior to the application, shall be between ages of 65 and 80, shall make payment of $300 with the application, be able to furnish own room and supply own clothing. Any other funds the applicant may have are to be deposited with the management of the home, the entire income, however, to be available to the inmate but the property to revert to the home at death. Other homes are Pacific Old People's Home, 1055 North Kingsley Drive, Hollywood; Old Folks Home (colored), Watts, Los Angeles County. There is a home for aged members of the Masons at Alhambra. The Odd Fellows have a home in the northern part of the state, as doubtless do other fraternal organizations.

Communities of the Pomona Valley are cooperating in a plan for protection of forest reserves from fire.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Distribution of Furniture

An estate consists of furniture of house and wearing apparel. There are four daughters, heirs of the estate. The administrator arbitrarily makes a division of the property, to which one of the daughters objects. What shall she do to enforce her objection, and had the appraisers the right to place a valuation upon the property?—Subscriber, Imperial.

It is the appraisers' duty to appraise all of the property of the estate. The administrator did, probably, what the ordinary person would do, but his action is not final until by virtue of the final decree of distribution the court confirms the distribution made. In order to obtain this final decree the administrator must make a report to the court and petition for the distribution. At the time of the hearing of this petition the heir who is not satisfied with the division could object and have a proper division made.

Community Property

Husband and wife own community real property. The deeds are made to them as husband and wife. Can deeds be changed so that the property will vest in the survivor without the necessity of administration of the estate of the one dying first?—Subscriber, Arroyo Grande.

It would be necessary to deed the property to some third party and have that third party deed it back to the husband and wife, and the deeds should read to the husband and wife or to the survivor thereof in joint tenancy.

Fencing Right of Way

A sells to B a parcel of land a quarter of a mile from the highway and deeds a strip of land 15 feet wide as a right of way for road purposes. Recently A has acquired a strip of land along this right of way and now declares his intention to fence in the right of way and install gates. Has he the right to do that?—Subscriber, Indio.

The land being deeded for a right of way, B has an absolute right to go over that land and to have that right of way in the same manner that it was when deeded, and the seller of the land has no right to in anywise change the right of way which he granted. B would have the right to tear down the fences and the gates, just as he would if they were placed on his own land.

Right to Water

A sold a parcel of land to B and thereafter for three years has sold to him water to irrigate that land, although no written contract exists. Can A refuse to furnish further water and thus cause B to lose a crop of fruit and incur great damage to his trees? A also occasionally furnishes water to another party.—Subscriber, Indio.

It would appear that A has made himself a public utility amenable to the rule of utilities, and it is also possible that by the purchase of land with water as it was, the land of the vendor might be impressed with an easement in favor of the land of the vendee to receive that water, but sufficient facts are not stated so that a positive opinion could be given.

Separate Maintenance

Husband and wife are full partners in real property and stock. The deeds are made to both and the property was acquired through their joint efforts as well as through money inherited by the wife. Can either one trade or sell the stock without consulting the other? If wife should leave husband what would she be allowed for separate maintenance and what action should she take?—Subscriber, Maywood.

In the case of a general partnership each partner is the agent for the partnership in the transaction of its business and has the right to do whatever is necessary to carry on such business in the ordinary manner; thus, considered from the standpoint of partnership, either one would be entitled to sell property. A husband has the management and control of the community personal property with absolute power of disposition except that he cannot make a gift of it or dispose of it without valuable consideration. He does not need the consent of the wife to dispose of the community personal property. If the wife desired to apply for separate maintenance it would be necessary for her to file an action in the superior court, setting up the particular facts showing why it is impossible for them to live together and sufficient to legally constitute a cause of action for cruelty or other cause. The matter would then come up before the court, which would determine from the facts and from property of the parties whether or not she was entitled to separate maintenance, and if so, how much. No definite amount could be stated as that is entirely in discretion of the court.

By a recent ruling of the secretary of the department of the interior, land owners in the Paradise Valley, which is north of the Salt River Valley, Arizona, will be permitted to build irrigation dams on the Verde River. Under terms of this ruling the land owners will finance the project which later will be consolidated with the Salt River Valley project and all operated under one joint management. This proposition is to be put up to the land owners of both districts for final decision.

The first iced car of fresh fruit ever shipped from Wasco was a car of Beauty plums, shipped June 15 to Los Angeles. The second car was made up of plums and peaches. Both of these were from the orchard of E. Deming. He experienced no difficulty in securing plenty of good American help.

Varying Orchard Practices

By Ernest Braunton

THE writer recently spent several hours in the orchards of C. C. Chapman at Fullerton, tramping over the ground with the owner and his superintendent, Lloyd Hulburt. As we stood in the midst of the large trees that have made the names of Chapman and "Old Mission Brand" famous throughout the orange world, Mr. Chapman said:

"These Valencias are 26 years old and used to be prodigious producers, but of late years the yield has gradually become lighter. So we have been doing some heavy pruning, both in beheading and in thinning. Now look at the heavy crop that has set. It looks like old times—the trees have 'come back.'" And so they have, for every tree in every part is loaded with tiny oranges from the size of peas to marbles, and the "set" is splendidly distributed.

Blow Out the Stumps and Rocks
Placing cartridge of dynamite in bore hole preparatory to blasing stump.

The Rejuvenated Trees

Some of the trees had been both tall and thick of top, so that the interior was bare of foliage and fruit, dark and gloomy, with but an outer cloak of active leaves amid which hung the annually diminishing fruit crop. Some of the oranges were so high that picking was difficult and expensive. The taller limbs were cut down a few feet to a side leader hanging outward, the interior was cleared of any large branches filling the center, and often these were three or more inches through. The trees are now so thin one may look through the crown and see ripe oranges on the opposite side, and much fruit is hanging on the inside, for the first time in many years.

All this improvement in crop production is due to judicious pruning, for the trees have been well fed every year. About the first of December each tree was given 20 pounds of a complete fertilizer running about four per cent nitrogen, eight to ten per cent phosphorus and two per cent potash. This was applied by hand, from pails or buckets, underneath the tree, not in the outer field. The zone treated extended from within a foot and a half from the trunk to a foot beyond the drip. This made a ring about five feet wide. It was scattered on top of the soil and lightly scratched in by toothed "hand hooks" and left for the rains to carry down.

Two More "Meals"

Later a single furrow ten inches deep was made down the rows, one way only, and into this a high grade dairy manure was placed, about eight cubic feet to a tree, a manure running about a half of one per cent in potash, one per cent of phosphorus and one and a half per cent of nitrogen. This was covered with a furrow turning the soil back in its original place. These trees are very large; for small trees it is advised to run a furrow on each side of the row, about two feet outside the drip. Next year the furrows will be run across the other way and the same treatment given.

For the "supper" or third meal of the season, an unusual feed was provided, a pet scheme of Mr. Hulburt's. Inside the drip of the tree and about four feet away from the trunk four trenches were dug at the four corners. Each was a foot deep, a foot wide, and three feet long. In these four trenches about six cubic feet of stable manure was placed, tramped down and covered over. Mr. Hulburt argues that being under the tree the manure cannot be cultivated out of the soil, exposed to the sun and burned up, and that the soil temperature under the tree is about right for most favorable bacterial action. This feeding is in the nature of an experiment and the results will be noted for two years as against the yield of trees not so treated. This makes more than two dollars worth of food given each tree a year, about equally divided between dairy manure and commercial fertilizer.

Other Orchards

The Valencia grove is but one of several orchards Mr. Chapman has. This one is on a free sandy loam; others are on soil so heavy that large quantities of Riverside "potash lime" are being applied to improve the physical condition of the soil. A one year Valencia orchard of 25 acres is second to none seen by the writer and a four year lemon grove contains the largest trees of that age observed anywhere.

In spite of these fine orchards Mr. Chapman has the greatest range of conditions to be found in the state, a veritable citrus museum. Some orchards look like horticultural hospitals, except none of the patients are improving, and trees may be found from the vigor of perfect health to the last "agonizing throes of complete dissolution." For Mr. Chapman kills many trees by overfeeding. His practice has been to feed to the uttermost until the trees, suffering from indigestion, dyspepsia and other ills that trees are heir to, can no longer produce a commercially profitable crop. Then it is: "Yank 'em out" and replant. Whether or not this is the best system many growers doubt, but Mr. Chapman is noted for the money he has made from growing oranges, so we leave it with the orange producing reader to pronounce judgment on the Chapman methods of forcing production.

Book Review

PRODUCTIVE SOILS

"Productive Soils: The Fundamentals of Successful Soil Management and Profitable Crop Production," by Wilbert Walter Weir, M. S. Published by J. B. Lippincott Company. Philadelphia.

"The chief concern of the human race is its physical needs. Its greatest needs—food and clothing—depend entirely upon the soil which is intimately associated with life. Myriads of plants and animals have lived upon the earth for ages and ages because soil exists. Every nation is deeply interested in the soil and its crops. Shall we grow more wheat to meet the demands of our increasing population, or shall we import it? Shall we meet the demand for more cotton or shall it be grown elsewhere? Are our working people to have meat on their tables in the years to come, or will the price of meat be beyond their means? These questions can be answered only by the soil."

The above statements and questions open a discussion of soil problems, and the following few paragraphs lead up to the fuller discussion of soil and its origin: Soils from a Chemical Point of View, Soil and Plant Relations, Crop Production, Factors Determining Soil Fertility, Crop Production Affected by Systems of Cropping, Application of Principles to Management of Special Soils, Principles of Soil Fertility Applied to the Farm as a Whole and Other Points on Soil Management. There are 24 chapters covering nearly 400 pages, interspersed with maps, figures, half tones and line engravings. It is a book designed primarily to meet a growing demand for definite, practical and complete information concerning soils and profitable crop production "This, therefore, is a book of fundamentals and hence applicable to a wide range of country. The basic facts concerning soils and the fundamental principles of successful soil management are essentially the same everywhere, but the methods of application must necessarily vary because of different climatic conditions." The book is one of the Lippincott Farm Manuals of which they have now published an even dozen. It is a valuable series and this particular number is of value to orchardist, general farmer or even livestock breeder

---

SOUTH AFRICAN FAIR

After a lapse of three years on account of the war the Port Elizabeth Agricultural Society has this year revived its annual agricultural show. The livestock entered, while small in numbers, was excellent in quality, especially in the cattle division. Shorthorns, Frieslands and Afrikanders were particularly worth seeing. Grains, seeds and vegetables of the highest quality were displayed, and the exhibit of apples was a revelation to those who consider South Africa a poor apple country. Dried fruits of first class quality were also shown. Wool, mohair and ostrich feather exhibits were not strong in numbers, but were excellent in quality.

60,000 CRATES PER DAY NEEDED

Tap-tap! Tap-tap! is what a fellow hears for nearly a mile up and down the Southern Pacific road in Brawley nowadays. It comes regularly and is emphatic. First a sharp blow to send the nail in, then the lighter blow to send it home, and in a twinkling the cantaloupe crate is made, whether it be for a crate of flats, a crate of ponies or a crate of Imperial Valley's proudest, a standard with 45 prime "cants" snuggled away and ready for the Waldorf Astoria in New York, the Blackstone or Congress in Chicago, or the famous hostelries up and down the Pacific Coast.

These crate makers don't hesitate over their work. They can't and get away with a living. Some of them go high up into the hundreds, but to tell what any one crate maker can turn out in a day would at once start several hundred arguments in Brawley. As a matter of fact, 500 daily is the average. That is on a ten hour basis and means that 25 crates are made every 30 minutes—almost one a minute.

F. W. Williams, one of the makers at F. H. Speich & Company's sheds, talked right along to a News representative and did his tap-tap, tap-tap just the same. He had the touch system a la typewriter expert. He could hit those nails and never hit his thumb a single time, and yet look at the man he was talking to; and what is more in the way of phenomena—he could talk, too. He modestly says there are lots of the boys here faster than he is, but that 500 a day makes a fellow tired and ready for the hay after evening chuck time.

At the present rate of shipping it takes about 60,000 crates a day to handle the cantaloupe crop of the valley. That many are not being made each day because there was an accumulated surplus at the beginning of the season and it is being used along with the daily output.—Brawley News.

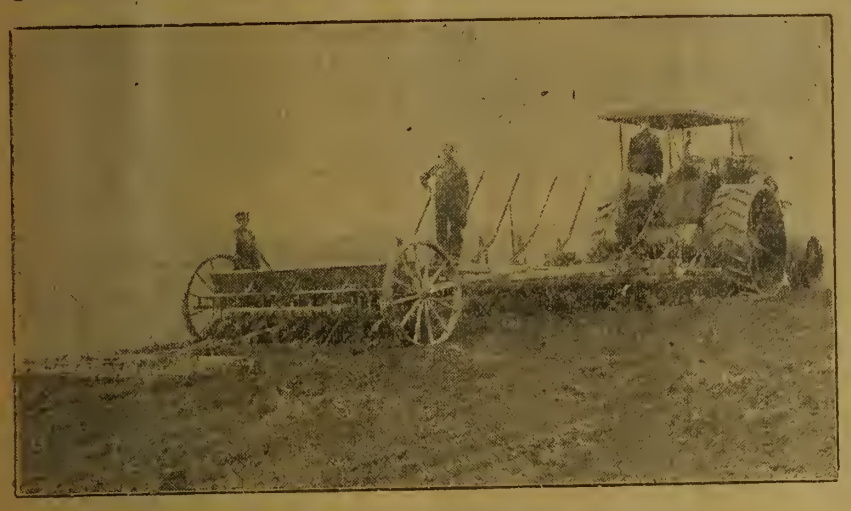
LEARNING BY DOING

(Continued from Cover Page.)

Ventura, Los Angeles, San Bernardino, Orange and Riverside Counties, where a couple of days was given to the study of intensive cultural methods followed in the desert section.

Dr. Coit accompanied the class for only a short portion of the trip. Assistant Professor J. C. Johnston, with Mrs. Johnston as chaperon, accompanied the party throughout the entire six weeks of the trip. Four of the students were ladies.

The practical lessons of the trip were not only in observing the methods followed by practical and successful orchardists, but in doing, under the supervision of the experts, actual field work. The illustrations on cover page show members of the class sticking buds of Washington Navel trees on the young seedlings in the nurseries of the R. M. Teague Company, San Dimas. They were instructed as to details of this work by W. T. Preston, a budder of years of experience, and in the handling of tropical fruit trees, avocados, cherimoyas, and a dozen others, by G. E. Grow.



Preparing Seed Bed and Drilling at Same Operation

This is the first of these practical field studies since the beginning of the war. Prior to the war there were a half dozen classes shown over the same sections, but not so extensively, this year's trip covering over 2,000 miles.

The best part of the trip, so far as Cultivator readers at least are concerned, is that which will be given in the columns of the California Cultivator some two or three weeks later. Each member of the class has been asked to contribute a short article answering this question: "What is the one biggest lesson which you have learned from the entire trip?"

CALIFORNIA OAK WORM

The California oak worm at times ravages trees from Sonoma County to Southern California, and the following valuable facts and advice as to its handling are offered in Farmers Bulletin 1076, by H. E. Burke and F. B. Herbert, forest specialists.

"The live oak and the valley oak, which are characteristic of the landscapes of California, often are stripped of their leaves by a dark striped worm which is the young stage of a light brown moth. Besides stripping the trees of their leaves and making the owner think that they are dead, the worm crawls on lawns, walks, fences and into houses, swimming pools, etc., becoming a general nuisance.

"Two generations of the pest occur during the year. The worms are most noticeable during April and May and again in August and September; the moths, during June and July and again in October and November. The best method of control is to spray the worm infested trees with a mixture of 3 to 5 pounds of arsenate of lead paste or 1½ to 2½ pounds of the dry powder dissolved in 50 gallons of water. This should be done while the worms are small. The live oaks should be sprayed in April and again, if necessary, about the first of August, when the deciduous oaks are sprayed."

UTILIZING GRAPE SEEDS

A prominent chemist discusses, on the basis of data obtained from various waste producing stations in the tomato pulping and grape juice industries, the possibilities of the commercial utilization of the canning house waste. The commercialization of such waste is thought to be profitable only by assembling the waste from readily accessible localities at some center and there extracting the oil. A greater profit is considered possible if the seeds are first separated from the other waste and then shipped to the central plant, and if the Cobwell system of grease recovery from garbage is used for the extraction of the oil.

CITRUS CROPS IN GREECE

The United States consul at Patras reports the 1919 citrus crop of western Greece at less than half of normal, based on the average for the past ten years. This reduction emphasizes the ravages of the Mediterranean fruit fly, Ceratitis capitata. Citrons and quinces suffered from it less than any and all classes of oranges. The lemon crop for western Greece is about two-thirds of normal and the falling off is ascribed largely to the extensive ravages of the red scale, Chrysomphalus minor.

ROOT TUBERCLES

When the farmer finds tubercles on roots of plants it is generally conceded that they are nitrogen nodules on leguminous plants and nematode galls on other plants. Exceptions to these are fungus galls on some fruit trees. These latter are not uncommon on ornamentals. They are found on roots of alder, mountain lilacs, eleagnus, wax myrtle and other trees and shrubs. O. F. Cook also found nodules on the roots of a palm native to Southern Florida, seemingly not the product of any disease, the uses of which have not yet been clearly determined.

FORESTRY NURSERY

The California state civil service commission held its final examination for forestry nurseryman on May 29, and it is expected an appointment will soon be made. Following this a nursery will be established for the growing of young stock for reforestation work. The examination call states: "The duties of the position include the supervision of the construction and operation of a nursery with a capacity to supply a producing area of 25 acres."

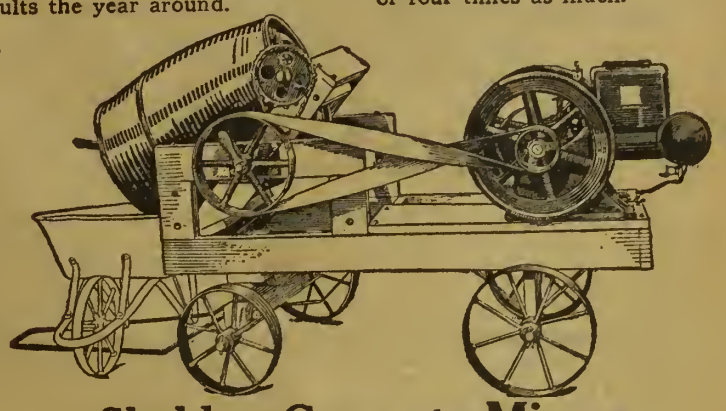
GLORIOUS GLADIOLUS

Last week we saw some gladiolus that would strongly appeal to anyone who deigns to cast even a casual glance toward the floral tribe. There were thousands of them, bred up to a high standard through careful hand pollination over a series of years. The stalks were four to five feet high, heavy and vigorous, the leaves long, broad and of dark color. The flowers were nearly every hue but pure blue, ranging from white to crimson, to purple and yellow. They were of large size and in some instances bore 11 full blown flowers or florets before signs of decadence in the first blown. This is a grand uplift in a popular garden flower and well illustrates the triumph of the skilled and scientific plant breeder.

A Concrete Mixer At Every Man's Price

We consider ourselves very fortunate in securing the exclusive agency in this part of the country for the Sheldon Concrete Mixer. It fills an old need of the contractor and farmer; that of a reliable low-priced mixer that will give perfect results the year around.

The price of the Sheldon Concrete Mixer puts it within reach of every man. In fact, it costs so little that it soon saves its cost in labor saved alone. And the work it turns out would do credit to mixers costing three or four times as much.



Sheldon Concrete Mixers

In this day every farmer and contractor is looking for an economical, labor-saving method of putting in concrete. The Sheldon fills the bill. Farmers and contractors all over the United States—thousands of them—are using the Sheldon and getting perfect results.

The Sheldon is a sturdy machine, built exclusively for the man who does not want to invest a lot of money in a mixer. However, when a big job comes along, the Sheldon will handle it. It will mix a batch of concrete in from one to two minutes—some users have written us that they have mixed as high as five yards an hour. That is enough concrete to take care of almost any job.

But on small jobs one man can run it and turn out just as satisfactory work as when he is using a whole crew.

Call on us and let us show you the Sheldon—or write us and we will send you a catalog describing every detail of the different models.

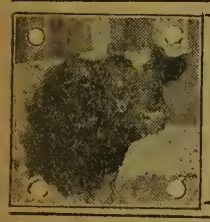
Box 220, Route 2. East 26th and Downey Road, Los Angeles



USE A SHORTHORN BULL

By doing so you will increase the weight of your cattle from two to three hundred pounds at maturity. One advantage of Shorthorns is that they finish readily for the market at any age or may be carried along for a period in case the market is not favorable, and continue to make gains and not lose finish.

Week after week Shorthorns top the leading markets and show an excess of weight also which is a double advantage.

It pays to grow Shorthorn beef.

The City Movement

By A. L. Spellmeyer

THERE is a menace in the movement towards the city—a national danger and possible calamity. The cities are bragging of their population increase as if it were a sign of prosperity, but it's a danger signal to warn us. The very value of the city lot depends finally upon the prosperity and production of the farmer and the stockman.

The city has its duty and is neglecting it. The city is the market place and manufacturing point for products and should attend to that end of the economic problem. The city is the money center to supply the lifeblood of finance for production and the encouragement of producers.

You hear that this city is great on account of the rich country back of it, that another city won't amount to anything because it hasn't any back country; but, blind and ignorant and selfish, the cities today withdraw money from production, increase complicated handling expense of food, provide manipulated markets, and ahead of them is the famine which has followed war throughout the generations—unless they change their conduct.

The claim I have repeatedly put out that cattle shortage is menacing the country is being partially realized already, and we hear from Chicago the prophecy that 20 cent beef will be the November price, made right now when a man can't sell steers for half that price in Los Angeles. We hear that the calf crop is 22 per cent short and that cattle declined last year. If the national calf crop is short 22 per cent it means a fifth less yearlings next year and a fifth less big steers the following year. We hear that slaughter has increased nine per cent at the same time. Just as surely as the sun rises there is an inevitable cattle shortage which will affect grain, soil and farmers, affect a thousand branches of manufacture and pile a big loss upon the nation, which consumers must liquidate. Whether or not this will do us cattle producers any good in many instances at this time, when we are short of feed and money and are being forced to a sacrifice market, remains to be seen. A lot of us will go under before the turn comes, probably, and that will merely be our little contribution to final shortage.

We are told that about ten per cent of people formerly were engaged in general food production and that in two years four per cent of them quit I don't vouch for the figures. We are warned to produce more, but the warning is idle words without any backing to help.

The city has its duty, and if the city is to prosper it must provide markets and money. Today meat is at its highest point to consumers and, considering production costs, lowest point to producers. It would seem that it's the city's duty to provide a shorter road between producer and consumer. Cattlemen are losing $20 to $60 per head on steers today. The consumer is paying $200 to $300 for the same steer the producer gets $96 for. The producer is losing money; the others making more than ever before.

Never was there such a logical time for establishing municipal abattoirs or small independent slaughter houses, providing large municipal cash meat markets are established. Meat should be a third to a half less to the consumer and more to the producer if the complicated controlled and wasteful marketing road was straightened out. The city is calling loans and the producer sacrificing his very principal in breeding stock to meet them.

Who is to blame for this city movement? How can you expect a man to sweat, worry and labor with bad markets, drouths and blights, for an uncertain paltry return, and probable loss, when he can go to the city, live comfortably and earn $5 to $10 a day? If he could do better in the country we would see a great back to the soil movement.

The remedy is to make production profitable. Make production profitable if you have to tear down the total oligarchy of devious marketing control. or there won't be food production to permit it. Food production is the big question now. A full stomach dislikes a quarrel. Make production profitable and you will have the production and start right in with giving the cattle producer at least a price to break even. In common justice he needs it.

If you doubt the trend, look up the facts yourself. You can get them from a dozen books the government prints, and, Mr. City, quit bragging about your population and get down to work yourself, providing money and a market for production on fair margins, or you are going to face hunger and hard times, depleted values, and no occupation for millions who won't have the raw products to work with.

The Best Age to Breed Gilts

As the animal grows and the various organs increase in size the several functions of the body become more clearly differentiated. As a certain stage in this process of development and growth the domestic animal arrives at the period of puberty, which marks the beginning of the time when the young animal is capable of producing young. In practice animals are seldom used for breeding purposes at the beginning of the period of puberty, says F. B. Mumford, dean of the college of agriculture, University of Missouri.

Very young animals are not bred, even though capable of producing young, because the breeders of livestock know that under certain conditions bad results are almost sure to follow. Breeders quite generally believe that the practice of mating very young females results in checking the growth of the mother, and in some cases the effect may be so marked as to permanently reduce the size of the mature animal. It is also believed by some breeders that the offspring of very young parents are less thrifty, smaller and in general less valuable for breeding purposes than the offspring of more mature parents. But the most serious result claimed has been that the continued breeding of very young parents will untimately result in decreasing the size of the breed. This result could not follow unless the hereditary qualities of the breeding animals themselves are influenced by this practice. It must be admitted that if any of these results do follow the mating of immature animals the question becomes immediately a matter of great practical importance.

At the Missouri experiment station for six years an experiment was conducted for the purpose of determining the results of breeding very young females for several generations. To determine just what temporary or permanent effects, if any, follow this practice, the experiment station has bred one group of sows and their offspring at the first appearance of heat. and this practice has been continued through many generations. Another group of sows have been bred first when half matured and still another group at full maturity.

The most significant effect that can be measured is the dwarfing effect which early pregnancy and lactation has upon the mother herself. The young sow that is bred to farrow at eight or nine months of age stops growing for a time. If she is well fed, and bred only once a year thereafter, she may practically recover from the dwarfing effects of early gestation. If the sow is not generously fed, or if she is bred twice a year, even with the best of feeding, she is permanently affected and will be smaller at maturity than other sows bred at an age when the body is better developed. This result on the mother is not a serious matter if she is well fed throughout her life.

It is a popular opinion that gestation is a serious drain on the physiological system of the pregnant mother. It has been generally taught that a sow in pig must not only maintain her

bodily functions and provide for normal growth, but must furnish the nutritive material essential for the development of the unborn young in the uterus.

The investigations at the Missouri station indicate that pregnancy is not an exhaustive period. The young pregnant mother will grow normally without great additional increase in the food supply. Indeed, there is a suggestion in the results so far obtained that pregnancy may actually increase the nutritive efficiency of the mother during gestation to such an extent that growth actually proceeds more rapidly.

How does it happen, then, that breeding immature animals results in checking the growth and decreasing the mature size of the mother? The exhaustive factor is lactation. In all of the cases studied it was found that while the growth of the immature mother proceeded without interruption during pregnancy, after the birth of the pigs and all during the period of lactation the growth was apparently stopped. No apparent growth takes place while the mother is suckling young. After weaning the pigs the immature mother begins to grow. During this period she may even grow more rapidly than other sows of the same age which have not passed through the periods of pregnancy and lactation. We must conclude, therefore, that the great cause of the dwarfing of the young mother is the strain of lactation and not of pregnancy.

The offspring of very young or immature mothers show every evidence that they are as thrifty and as valuable for every purpose of practical animal husbandry as the offspring of the more mature mothers. It must be remembered, however, that the immature mother is not able to supply as much milk for the nourishment of a litter, and consequently special care must be exercised in providing an abundant supply of nutritious food, otherwise the offspring of the immature mother will be smaller and weaker. This result, however, if it occurs, is due solely to a deficiency in the food supply and not to any hereditary effect.

It must also be said that no evidence of any sort has been obtained which would indicate that the long continued practice of breeding immature females will result in decreasing the size of the breed. The capacity to develop a certain size at maturity is hereditary. The breeding of young females does not affect the fundamental constitution of the germ plasm in which are to be found the inherited qualities that determine the final character of the breed.

What, then, is the best age to begin breeding young sows? The answer must be that this will be determined by the purpose of the breeder, but primarily by the development of the young sow. A well fed sow that shows good development may be safely bred younger than sows kept under ordinary farm conditions. It is certain that sows bred to farrow when one year old will be checked in growth, but this is not necessarily a permanent effect.

It is clearly shown also that young sows and their litters must be more generously fed than older sows, otherwise the sow may not reach the normal size of the breed at maturity. Breeders of registered hogs whose object is to produce the highest developed and most perfect types of their particular breed at every stage will find it better to delay breeding to a somewhat later time and thus avoid the check to development which is sure to follow lactation.

From an economic point of view the sows which are mated young are generally more profitable than those which are allowed to remain open too long. The exercise of the breeding functions at a younger age is also generally favorable in developing in the young female all those physiological qualities which we include under the term "the breeding powers of the animal." Probably the best general rule for commercial hog raisers is to breed young sows at about eight months of age.

Calves Make Biggest Gain on Heavy Skimmilk Ration

How much skimmilk should be fed to calves daily?

Results obtained thus far at the dairy division experiment farm Beltsville, Maryland, indicate that calves will make the greatest gains in weight when fed comparatively large quantities of skimmilk daily (one-fifth of their body weight, or all they will drink), but that the most economical gains are made on smaller quantities.

In an experiment to determine the effect of feeding various quantities of skimmilk, 16 calves were divided into groups of four calves each. These groups were balanced as nearly as possible with reference to breed and body weight at birth. One group was given a daily ration of one-seventh of the body weight, the quantity being regulated by body weights taken every ten days. Two other groups were fed at the rate of one-sixth and one-fifth of their body weights; and the fourth group was given all the milk the calves would drink, twice a day.

Each calf received its mother's milk until it was ten days old. The change to skimmilk was then made gradually, and at the age of 15 days the calf was on an entire skimmilk ration. The experiment ran for 70 days. Weights obtained for three consecutive days, at the end of the 70 day period, were taken as the final weights. The average results from each group are given in tabular form:

Rate of feeding	Daily gain...	Milk per day.	Milk per lb. gain.....
	Lbs.	Lbs.	Lbs.
Group 1 (one-seventh of body weight)	0.95	13.52	14.4
Group 2 (one sixth of body weight)	1.09	16.99	15.6
Group 3 (one-fifth of body weight)	1.26	20.96	17.0
Group 4 (all they would drink)	1.48	24.22	16.6

The groups were well balanced as regards weight and thrift of the calves.

The gains increased with the quantity of skimmilk fed, the calves which received all they would drink making gains at least 50 per cent larger than those receiving milk at the rate of one-seventh of their body weight. To do this they drank about 80 per cent more milk. As a consequence the skimmilk required for one pound of gain was greater with the heavily fed calves.

No bad results from heavy feeding were noticed, although all of the calves in the group, fed all they could drink, with one exception drank at times more than 40 pounds of skimmilk a day. This leads us to believe that overfeeding is not in itself a common cause of scours.

JERSEY CLUB CHARGES TRANSFER FEES

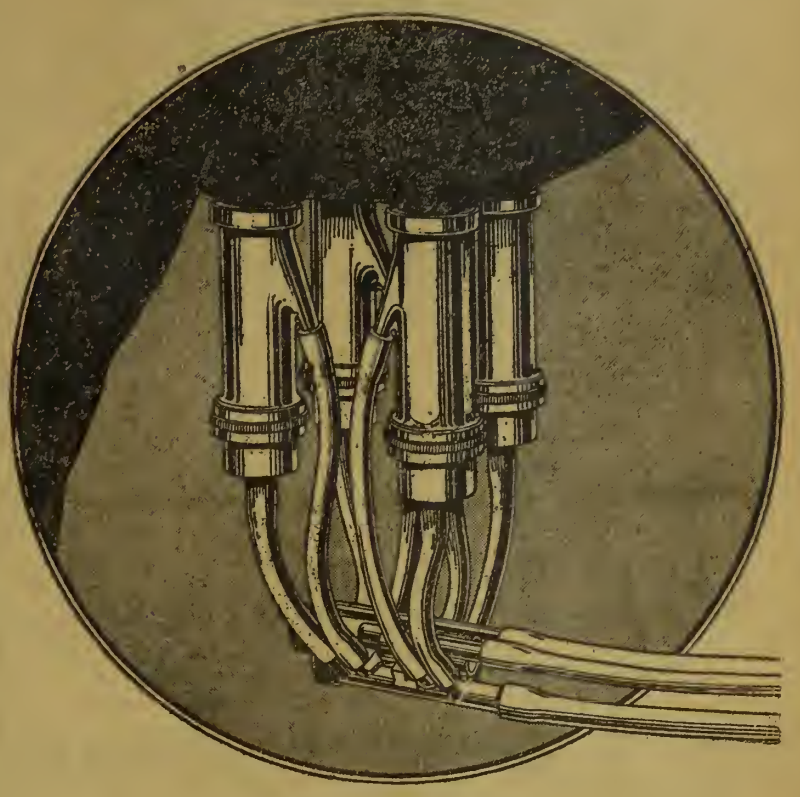
The American Jersey Cattle Club announces that on and after July 1, 1920, transfers will be charged as follows:

All transfers under 90 days from date of delivery and all transfers of animals under two years of age accompanying application for their registry: To members or non-members, $1 each. All transfers presented after 90 days from date of delivery: To members or non-members, $2 each.

The California Dairy Council has just issued a 24 page booklet, "The Food Values of Dairy Products," that is a most complete treatise on the subject. It is the intention of the California Dairy Council to place these booklets in the hands of every teacher of home economics and physical education in the schools of California, as well as many doctors and leaders in welfare and child hygiene work. Such publicity will result in stimulating a wider and more stable market for all dairy products.

Thirty-five cars of whiteface steers were recently shipped from the Horseshoe Ranch near Prescott and 15 cars from the Charles T. Mullen ranch, Skull Valley. These all go to big feeders of Denver, Colorado.

The De Laval Milker



De Laval Udder Pulsator--the Only Pulsator Close to Udder

Among the many new and exclusive advantages in the construction of the De Laval Milker, particular attention is called to the Udder Pulsator and the teat-cups.

The Udder Pulsator is located within a few inches of the cow's udder, which insures positive and snappy action in the teat-cups. The action is uniform, gentle and pleasing to the cow. The only moving part in the pulsator is a small, plain piston which requires no oiling, adjusting or repairing.

The weight of the teat cups and Udder Pulsator has been carefully and scientifically worked out to produce the best and most satisfactory results. The De Laval teat-cups are self-adjusting and made in one size only, which fits all teats.

The construction is so simple that they can be easily taken apart, cleaned and put together. No metal touches the teats, and the only rubber part is the liner, a straight piece of pure rubber tubing. Every other part of the De Laval Milker is equally simple, practical and efficient.

The name "De Laval" is insurance of satisfaction.

California State Dairy Cow Competition

Announcement has been made of a competition that will be of direct interest to all dairy farmers and breeders of dairy cattle in the state. The college of agriculture of the University of California will conduct the competition as a part of its educational work for the advancement of the dairying industry of the state. It has been rendered possible by the generous assistance of interested parties, who have contributed large amounts of money for a cash prize fund, or will give registered dairy bull calves and silver trophies to be awarded as special prizes.

Competition open to all cows in the state, irrespective of their breeding. There are four competing classes: pure bred Jerseys and Guernseys, pure bred Holsteins, pure bred Ayrshires and Dairy Shorthorns, and grade or common milk cows. Grade and common cows of mixed breeding will therefore not compete with pure breds, but only among themselves.

Prizes will be awarded for records of production of butterfat during ten consecutive months by ten cows in a herd and by individual cows, for the highest monthly production by single grade cows and by five grade cows in a herd, for records made by herds owned by members of a cow testing association.

Prizes

The cash prize fund so far subscribed to be distributed amounts to $3,825 in all, which will be awarded in 32 different prizes ranging from $25 to $300 each. Ten special prizes, valued at nearly $2,000, will be awarded, viz., three pure bred dairy bull calves and six silver trophies and two gold medals. Cash prizes aggregating about $1,000 in value and nearly all the special prizes will be awarded for records of production made by grade or common cows only.

Determining the Production of Cows

The production of milk and butterfat by the cows in the competition will be determined by the system of semi-official testing of dairy cows. Supervisors of dairy tests employed by the college will each month make two day tests of the cows entered and certify to their production of milk and butterfat for this period. In the case of grade herds, tests of one day's duration only are required. Tests for members of cow testing associations are made by the association tester, except twice during the record period, when supervisors of dairy tests regularly employed by the college will conduct the tests.

Expenses

The two day tests cost $10 each, and the one day tests $7.50 each, making the total expenses for the ten month testing period $100 for two day and $75 for one day tests. These amounts are the only direct expenses connected with the competition; in addition, farmers provide room and board for supervisors while on duty, and transportation to and from the nearest railroad station or ranch where tests are conducted. Herds owned by members of a cow testing association may be tested at an extra expense of $15 for the entire record period.

Maximum Tested at a Time

When milked twice a day, 15 cows; three times a day, ten cows; and four times a day, eight cows.

The competition will commence September 1, 1920, and will close January 31, 1922. Entries will close April 1, 1921. Entry blanks and further information concerning the competition may be secured by addressing Professor F. W. Woll, Superintendent of Dairy Tests, University Farm, Davis.

A $50,000 Holstein Sale

By T. J. Hitte

The C. W. Anderson dispersal sale of Holstein cattle at Burbank, June 17, proved an outstanding event. It was conducted by C. L. Hughes, sales manager for the California Breeders Sales and Pedigree Company, with Col. Ben A. Rhoades and assistants doing the block and ring work.

At the opening of the sale Mr. Hughes emphasized three features of this herd—uniformity of type, high production, and rugged health. That the point was well taken may be gathered from the snappy character of the sale.

Sixty-four females, including a number of untried heifers and two or three unweaned calves, sold for a total of $49,312, making a general average of $770.50 per head. A half dozen or more heifer calves were also sold separate from dam at an average of around $300. These do not appear in sale list.

A feature of the buying was the three angled contest for many attractive offerings waged by the Hartsook Ranch, Lankershim, the Sunshine Ranch, San Fernando, and the Santa Anita Rancho, Santa Anita. The high mark for the day was made on the great four year old Mabel De Kol Niko 2d, she going at $1,750 to the bid of Earl Sturgis for the Santa Anita Rancho. Lots 40 and 52 were secured by Fred Hartsook at $1,550 and $1,600, respectively, they being close up descendants of the great sires Beryl Luecke De Kol and Roderick Lincoln, that have made famous the great herd of cattle owned by H. Renaud at Phoenix, Arizona, the source of much of the Anderson foundation stock. The Sunshine Ranch purchases were largely along these same popular blood lines.

Prof. Gordon H. True of Davis was a liberal buyer of young cattle for foundation stock in the Hawaiian Islands.

A fine two year old daughter of Prince Gelsche Walker went at $950 to W. J. Higdon for his Tulare Holstein Farm herd. R. F. Guerin of Visalia was a strong bidder on some of the more valuable lots. Mrs. D. G. Maxwell of Burbank made some good selections early in the sale.

The sale was held in the shade of the big walnut trees of Edgemont Farm, and a large crowd was in attendance, many ladies being present. The barbecue lunch was of the very finest.

Below is detailed statement of all catalogued sales:

1, Beryl Mortum Luecke De Kol, May 27, 1916; Fred Hartsook, Lankershim, $800.
2, Mabel De Kol Niko 2nd, February 1, 1916; Santa Anita Rancho, Santa Anita, $1,750.
3, Burbank Mabel De Kol Niko, April 19, 1919; Santa Anita, $1,100.
4, Pauline Piebe Lincoln, September 20 1916, Sunshine Ranch, San Fernando, $900.
5, Queen of Fairlawn Lincoln, October 14, 1915, Burr Farm, Los Angeles, $650.
6, Split Silk Piebe Roderick, May 27, 1918; Pellisier Bros., Whittier, $300.
7, Banostine Mechthildc, May 2, 1918; Sunshine, $900.
8, Pauline Banostine Butter Boy, November 12, 1917; G. H. True, Davis, $500.
9, Mercedes Banostine Butter Boy, November 22, 1917; Mrs. D. G. Maxwell, Burbank, $775.
10, Beryl Janie Lincoln, April 17, 1916; Sunshine, $1,100.

48, Juliane Sadie Vale Pet, December 5, 1917; Hartsook, $1,000.
49, Joy Walker Burke, April 22, 1918; Santa Anita, $1,050.
50, Dora Abbekerk Sadie Vale, August 21, 1918; Sunshine, $550.
51, Lady Artis Segis Pontiac, April 5, 1917; Hartsook, $600.
52, Roma Abyle Luecke, February 11, 1916; Hartsook, $1,600.
52, (Heifer calf above dam), Hartsook, $650.
53, Jewel Abyla Roderick, January 24, 1916; Hartsook, $900.
54, Lady Abyla Luecke, February 28, 1916; Sunshine, $1,100.
56, Burbank Lady Juliana, November 15, 1916; Hartsook, $800.
57, Burbank Duchess Ormsby, April 10, 1919; Sunshine, $900.
58, Segis Fobes Tritomia, August 14, 1919; Jeffries, $700.
59, Juanita Uneeda Luecke Roxana, June 28, 1918; Maxwell, $450.
62, Guajalote De Kol Mechthilde, November 26, 1917; True, $325.
63, Florecita Bodera De Kol, March 30, 1912; Michael, $600.
64, Fen Pietertje Korndyke, June 28, 1916; Hartsook, $400.

LIVESTOCK DECREASING

A falling off in the numbers of cattle and hogs in the United States occurred during the first four months of this year, as compared with the like period last year, according to reports of special livestock reporters of the bureau of crop estimates, United States department of agriculture.

In the case of hogs, the births during January, February, March and April were about ten per cent fewer than in the same months last year. The marketings have fallen off about 15 per cent. The farm slaughter was about the same in both seasons, but the deaths on farms this year are over 40 per cent heavier than last year to May 1. Taking into consideration both the births and the deaths (from all causes), it appears that there has been a relative reduction of about five per cent during the first four months of this year as compared with the trend during the first four months of last year.

The births of calves from January 1 to May 1 were about 22 per cent fewer this year than last year. The net disposition of cattle by marketings, farm slaughter, and deaths was about nine per cent greater than last year; it appears that there has been a relative reduction of about six per cent in total number of cattle as compared with last year during the four months January 1 to May 1.

THE MAGIC OF MILK

The National Dairy Council is doing some exceptionally fine publicity work for milk and in fact all dairy products. One of its slogans is "At least a quart of milk per day per child"; another, "The milk way is the health way"; and there are others equally as catchy. Its latest piece of fine work is "The Magic of Milk," a 64 page well illustrated booklet showing a magician emptying the milk bottle of health and strength, of growth, of laughter and of sleep. The book contains 150 dairy dish and milk drink recipes. There are recipes for butter sauces, cheese sauces, cereals and other cheese dishes, together with ice creams, milk desserts, drinks and sweets.

Owing to the decrease in the number of dairy cattle in the Salt River Valley the Pacific Creamery Company has closed its condensing plant at Glendale. The condensary at Tempe was closed more than a year ago. This leaves only one small condensary in Arizona. The greatly increased acreage of cotton in the Salt River Valley has resulted in a loss of dairy cottle. Most of these have been shipped out. The owners of the condensed milk plants state that they will not be dismantled, as they expect that within a short time the dairy industry will be again revived and both plants will be operating.

MULE MARKET STAPLE

Compact, blocky mules of good proportions, with good life and quality,, are selling quickly and profitably, no matter what their size, says Wayne Dinsmore, secretary of the Horse Association of America. The top prices go for mules standing 15.3 hands and weighing 1,200-1,250 pounds. The market for them is as staple as for wheat and corn.

Farmer producers are selling ordinary mule colts at weaning time at prices ranging from $65 to $125, before incurring any appreciable expense for feed. At three years the mule standing 15.3 hands, weighing 1,250 pounds, easily brings from two to three hundred dollars, and at five a big sugar mule commands $500 or more.

Nor does there seem to be any risk to raising them. Mule colts are hardy, are not subject to blindness, sidebones, or other unsoundness common to horses. They are also capable of self protection from the time they stand on four legs until they retire from active service via burial.

D. E. Van Pelt, a farmer near Glenwood, Iowa, makes good use of their marketability. He says: "I take advantage of the fact that the heaviest demand for mules comes at a time when I can spare them. I buy eight big mining mules in winter, out of season, for about $450 a pair, to do my spring work. When the busy season is over, I sell them at $500 to $550 a pair. Then a little before I sell these mine mules I buy eight big mare mules for the sugar trade. I buy them thin at about $450 to $475. About January 1 I sell them. Last spring (1919), I bought two pair at $500 and $550, and sold them in January (1920) for a total of $1,700. They did summer and fall work and made me a profit of $550 besides."

HALF MILLION CATTLE TESTED FOR TB

From time to time the bureau of animal industry publishes a "communique" showing conditions along the wide battlefront where the allied forces of federal and state authorities are fighting cattle tuberculosis.

The latest report indicates that since the beginning of the movement in 1917 the owners of 500,000 cattle have placed their herds under supervision.

On April 10, 1920, 25,793 herds scattered throughout the United States, with a total of 537,240 cattle, were under the cooperative supervision of the department of agriculture and state veterinarians. There were 2,230 accredited herds—60,237 cattle known to be free from the plague. Over 115,000 cattle were on the waiting list to be tested as soon as the veterinarians can work with them. Still another lot of 58,331 cattle have passed through the first stage of the test without showing any dangerous symptoms. The least optimistic estimate indicates that two-thirds of this number will conclude the test satisfactorily, and add 170,000 cattle to the accredited column.

GROW STEERS

Shorthorn breeders are encouraged to grow more steers. In every herd are bull calves that would make greater profits if grown out as steers. Some may be of undesirable markings but of great quality. These will attract much favorable attention if finished as steers and give to the owner more publicity than if they are developed as bulls. Steers are handled easily on the farm and never fail to arouse the enthusiastic admiration of those who visit the herd. The American Shorthorn Breeders Association invites the Shorthorn breeders to consider this advantage which they have in their own hands. Nothing will do more to increase the interest in this breed than the developing of a few high class steers in the various pure bred herds each year.

The Marin County farm bureau has a committee in charge of a better bull campaign and in connection with the Sonoma County farm bureau is planning for a dairy bull sale to be held at Petaluma in September.

July 30, Conejo Ranch, Newbury Park.

Poland Chinas

August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J. Elliott and Alex D. McCarty, Tulare.

Shropshire Sheep

August 11, Butte City Ranch.

Shorthorns

August 11, Butte City Ranch.

Berkshires

August 11, Butte City Ranch.

The latest calf club to be organized in this state has just been started by the Petaluma chamber of commerce with the following boys and girls enrolled as members: Raymond Gambonini, Oscar Petersen, Everett King, Max Flohr, Albert L. Clark, Andrew J. Ayres, David A. Sweeney, Leslie Schwobeda. Florence McDowell, Charles Hinshaw, Wilmer Blanchard, Thomas Putnam, Sam Nisson, Robert Martinelli, Evelyn Foster, James D. Harris, V. Martinelli.

Caledonia Farms, West Sacramento, has just sold to James Barry, well known cattleman of Cottonwood, Shasta County, ten registered yearling Shorthorn bulls. The ones selected by Barry represent an extremely high class lot. Three were sired by Pine Grove King, two by Sultan's Marvel, two by Pine Grove Marvel, a son of Pine Grove King, two by Winsome Prince and one by Ringleader's King. Mr. Barry is one of the progressive cattlemen who believes in the use of well bred bulls and claims that production costs can be definitely lowered through the use of such bulls.

Roy M. Hagan, who is in charge of the club work carried on by the University of California in Northern California, last week selected a number of registered Shorthorn calves from the following herds: Edinger-Johnston Company, Hood; Senator Benjamin Rush, Suisun, and J. D. Rowe and Sons, Davis. From the latter herd five milking Shorthorn calves were secured. In addition to the Shorthorn calves two Holstein calves were purchased from J. M. Henderson of Sacramento.

Cattle Superintendent Condee of George Junior Republic, Chino, reports the junior two year old heifer Queen Lyon Segis as having just completed a 20 pound record for seven days butter production. She was bred and raised at the farm.

Sterling Smith, Route 1, San Diego, is known among Duroc breeders as a stickler for type and correct blood lines. The Smith foundation is direct from leading herds of the Middle West and stands favorable comparison with the best the breed produces in size, smoothness and proper underpinning. Some excellent December and March boars of Pathfinder blood are to be seen at the ranch.

Kyne and Cash, Perris, have secured a 16 months son of King Segis Pontiac Jannek, the Jeffries bull, to place at head of their herd of Holsteins at Sierra Vista Ranch. This young bull is to be dubbed Cappy Ricks.

E. R. Stalder, Wineland, is owner of the 1,800 pound Holstein cow Josie De Kol Fobes Tritomia. Mr. Stalder was pleased, accordingly, to see her ten months old heifer sell in the C. W. Anderson sale ring at $700. Her sire was King Segis Pontiac Jannek.

Earl Sturgis of the Santa Anita Rancho, Santa Anita, reports the recent sale of two young Poland China boars and one gilt to go to Walter L. Vail Jr., Colombia, South America. These March boars were the get of the two big type boars Orange Boy and Quality Bob, while the gilt was sired by Anokia Chief 1st.

R. W. Reynolds, Los Angeles, advises us that he was the buyer of the

The Youngest of Tilly's Family

The son of Tilly Alcartra and Carnation King Sylvia from the herd of A. W. Morris & Sons, Woodland, and for which A. C. Hardy and W. R. Shaw, Ontario, Canada, paid $50,000.

$1,200 cow in the recent Van Blaricon Holstein sale at El Monte. Glad to have the correction.

The San Fernando Valley Duroc Breeders Association held its regular monthly meeting at the Van Nuys high school building on Wednesday, June 16. George Waltemeyer of the Conejo Ranch gave a very interesting talk on growing out breeding stock in general and on developing the young boar in particular. The association also took this occasion to present a beautiful cup to be competed for by the pig clubs of the valley.

JUDGE OF POLAND CHINAS

When the Poland China Journal was informed that Prof. L. A. Weaver of the animal husbandry department of the Missouri University will judge the Poland China classes at the California state fair this fall, that very excellent journal said: "Professor Weaver is regarded as one of the best judges of hogs in America, and his selection as the man to tie the ribbons at the California state fair shows that the breeders on the Pacific Coast have been using their heads. They could not have made a better choice for this important work. Indeed, it is well known that Professor Weaver's name was under consideration at one time for the appointment as judge at the National Swine Show this year, but conditions were such that he could not accept. In a field where there are many new breeders, such as found in California, the selection of a judge for an event of this character is of the highest importance to the industry. A false step in selecting the prize winners is more likely in such a field to create a wrong impression than where the distinction between the types is more generally understood, as is the case in the Cornbelt. For that reason the action of the breeders and the California state fair management in selecting Professor Weaver to officiate as judge will be welcome news to breeders east of the Rocky Mountains who are looking to the Pacific Coast as a great undeveloped field for the extension of the Poland China breed. Professor Weaver was judge at the California state fair in 1918."

CANVASS OF LIVESTOCK BREEDS

Here are the relative standings in percentages and numbers of livestock breeds in the United States, as shown by an investigation recently made by the bureau of crop estimates, United States departmcnt of agriculture. Shorthorn cattle, Duroc-Jersey hogs and Merino sheep lead all other breeds in numbers. This information is brought out by replies received from an inquiry sent to 14,000 special livestock reporters of the bureau. The inquiry called for the following information: "Letting 100 represent the total number in your locality, what proportion of the total belongs to the breeds named? Grades and scrubs should be included in the breed in which the type predominates."

From the percentages thus obtained the figures representing the number of each breed have been determined from the January 1 estimates of livestock on farms. The numbers and percentages for the United States are as follows: For cattle, Shorthorn (Durham), the number is 15,429,000, or 22.6 per cent of the whole number of cattle; Herefords, 14,302,000, or 21 per cent; Holstein, 11,069,000, or 16.2 per cent; Jersey, 9,554,000, or 14 per cent; Aberdeen Angus, 2,479,000, or 3.6 per cent; Guernsey, 1,993,000, or 2.9 per cent; Red Polled, 1,772,000, or 2.6 per cent; Polled Durham, 1,033,000, or 1.5 per cent; Galloway, 534,000, or 0.8 per cent; Ayrshire, 412,000, or 0.6 per cent; Brown Swiss, 170,000, or 0.3 per cent; Devons, 175,000, or 0.3 per cent; Dutch Belted, 157,000, or 0.2 per cent; others, 2,107,000, or 3.1 per cent; nondescript (unclassified), 7,044,000, or 10.3 per cent; total, 68,232,000, or 100 per cent.

Beef Breeds Predominate

It will be observed that the beef breeds preponderated over the milk breeds. Holsteins are most numerous of the milk breeds; in the Northern states they are two to three times as numerous as the Jerseys; in the Southern states, however, the Jersey is three to five times as numerous as the Holstein; in other words, the Holstein decreases in relative numbers from north to south, and the Jersey increases relatively in going from north to south.

The relative rank of swine breeds is as follows: Duroc-Jersey, 24,914,000, or 34.2 per cent of all swine; Poland China, 20,308,000, or 27.9 per cent; Chester White, 7,788,000, or 10.7 per cent; Berkshire, 6,719,000, or 9.2 per cent; Razorbacks, 3,061,000, or 4.2 per cent; Hampshire, 2,834,000, or 3.9 per cent; Tamworth, 508,000, or 0.7 per cent; Yorkshire, 471,000, or 0.6 per cent; Cheshire, 248,000, or 0.3 per cent; others, 1,997,000, or 2.7 per cent; nondescripts, 4,061,000, or 5.6 per cent; total, 72,909,000, or 100 per cent.

Among the sheep the rank is as follows: Merino, 12,364,000, or 25.4 per cent of all sheep; Shropshire, 11,253,000, or 23.2 per cent; Rambouillet, 6,455,000, or 13.3 per cent; Cotswold, 3,504,000, or 7.2 per cent; Hampshire, 2,968,000, or 6.1 per cent; Southdown, 2,984,000, or 6.1 per cent; Lincoln, 1,862,000, or 3.8 per cent; Oxforddown, 935,000, or 1.9 per cent; Dorset, 357,000, or 0.7 per cent; Cheviot, 140,000, or 0.3 per cent; Leicester, 135,000, or 0.3 per cent; Tunis, 37,000, or 0.1 per cent; others, 1,681,000, or 3.5 per cent; nondescript, 3,941,000, or 8.1 per cent; total, 48,615,000, or 100 per cent. The Merino predominate in the Western range states, but the Shropshire largely predominate on the farms in the Eastern states.

CARE OF COWS AT CALVING TIME

For best results in milk production a cow should be in good flesh at the time of calving. Less trouble is experienced in parturition and from retention of the afterbirth when the animal is in good order, says D. G. Sullins of the Georgia experiment station. To bring about this condition at calving time requires care in feeding while the cow is dry or during pregnancy. The ration should be sufficient to get her into proper condition. The average length of pregnancy is 285 days, and as parturition approaches the cow should be on a laxative ration if not on pasture. If on pasture no special attention need be given to the feed.

Milking before calving is desirable only with the heaviest milkers, when it is evident that they are suffering greatly from the extension of the udder. Some claim that milking prior to calving helps to prevent milk fever, while others never milk a cow before calving. If milking is begun it must be continued regularly.

Complications seldom arise if the cow has been dry for a month and has had sufficient food to get her in good condition at calving time. When the cow is about to calve she should be looked after at least twice per day. If she is on pasture it is well to let her remain there, otherwise she should be in a box stall large enough to enable her to move about freely. The time of parturition will be indicated by the udder becoming distended and hard, and the relaxation of muscles and tendons on either side of the rump, leaving a hollow appearance on either side of the tail head. With these indications pronounced, parturition may be expected within 24 hours.

Unless assistance is evidently necessary the cow should be left alone at calving. As a rule the calf will be born within half an hour. If the calf is not expelled after an hour or two an examination should be made to see if the position of the calf is abnormal, in which case the services of a qualified veterinarian should be secured to assist in the delivery of the calf. The normal position is forefect first with front of the hoofs and knees upward, while the nose lies between the knees.

The cow is especially subject to retention of the afterbirth, and special attention must be given that it comes away. The afterbirth is usually expelled within a few hours after the calf when the cow is in good condition. Cows far along in years or in poor health are especially subject to this trouble. The feeder should avoid giving cold water or cold feed within the first 24 hours after calving. If the afterbirth is retained a serious condition of the cow is brought about

A Great Santa Anita Producer

Anoakia Pontiac Beets produced butter, 7 days, 25.26; milk, 560. She is now on semi-official test and making a very good record. She won third place as a three-year old in the Los Angeles Livestock Show in 1919. Property of Santa Anita Rancho.

by the absorption of poisons from the decomposing tissues. The fetid products that escape, and the offensive odors, make this condition easily known. In such condition a cow becomes thin and produces but little milk, which of course is unfit for food.

Effort should be made to prevent the retention of the afterbirth so far as possible. However, it may occur frequently in all herds. If it does not come away within 24 hours it should be removed by hand. There is no drug that can be used for the purpose. An inexperienced person should secure the service of a veterinarian as soon as it is evident that afterbirth will not be expelled. To delay gives time for the mouth of the womb to close, making it difficult to introduce the hand.

It should be borne in mind that the vitality of the cow is low following parturition. She should have careful attention and be brought to full feed gradually. For the first few days the ration should be light in character and in small amounts. A small amount of wheat bran with good hay has proved satisfactory in the experiment station herd.

CONEJO SALE

About 50 pure bred Duroc-Jerseys and the same number of Hampshires will be included in the big two day sale which has been announced by the Janss Investment Company on their Conejo Ranch for July 29 and 30. This will be one of the largest two day sales ever held in California and arrangements are completed for taking care of a very large crowd. A barbecue will be served each day of the sale, and special arrangements have been made by the company to provide transportation from their offices in Los Angeles.

The first day will be devoted to the Duroc-Jerseys, the second to the Hampshires. The Hampshire sale will include brood sows, bred gilts and open gilts. With Giant Wonder, sire Great Wonder and dam Grand Lady 6th; Big Model, sire Oakdale Model and dam Great Wonder's Lady; Pathfinder's Pride, sire Pathfinder and dam Pride of Elba, all recognized leaders, at the head of the Conejo Duroc herd, there is no doubt about the class of animals to be offered at this sale. The Conejo Ranch has furnished foundation herds for many of the biggest hog raising ranches in California. These sales include a foundation herd to F. E. Lewis of the Diamond Bar Ranch, consisting of 63 Durocs; a foundation herd to King C. Gillette of 28 Hampshires; Imperial Development Company, ten boars, Durocs; S. W. Greer of the "525" Ranch, 21 Duroc boars; a foundation herd to J. W. Jameson of 80 head of Hampshires; Willits, Patterson and Green, seven Duroc boars, and the Fontana Land Company, four Duroc boars.

GOVERNOR OF THE CHENE, FIRST GUERNSEY CENTURY SIRE

The Guernsey breed has its first century sire in Governor of the Chene. The one hundredth daughter of this famous sire to complete an advanced register record is Imp. Nellie's Gem des Blancs Bois, a six year old cow owned and tested by J. L. Austin of Pennsylvania. She was officially entered in the Advanced Register on June 2, 1920.

Governor of the Chene attained unusual fame in the dairy world through his own show winnings and through the Advanced Register work and the show winnings of his descendants. There are today registered in the herd books of The American Guernsey Cattle Club 264 daughters, and the even hundred of these in the Advanced Register have completed a total of 118 records. Fourteen daughters have completed two records each and two have completed three records each. The largest record was made by Imp Nettie of the Hupits, that produced 12,556.9 pounds of milk and 718.9 pounds of butter fat in Class C. Thirty-four records were completed in the two year old classes, 24 in the three year old classes, 24 in the four year old classes, and 36 by mature cows. The average of the 118 records is 9,288.7 pounds of milk and 453.11 pounds of butterfat. Twenty-two daughters have not been tested for the Advanced Register, but have daughters that have qualified for the Advanced Register.

Sixty-eight sons have been recorded in the American herd books and 28 of these have qualified for the Advanced Register. Thirteen other sons have one Advanced Register daughter each.

Governor of the Chene was dropped September 25, 1900. He was bred and owned on the Island of Guernsey. Several American importers made liberal offers for the purpose of bringing him to this country, but his owner, Thomas Le Prevost, l'Etienerle, consistently refused to part with him. He kept Governor of the Chene until 1915, when this famous sire, known wherever Guernseys are owned, unfortunately died, but probably no other Guernsey bull has more descendants living after him.

AYRSHIRE BREEDERS' ANNUAL

The 45th annual meeting of the Ayrshire Breeders Association was held at Springfield, Massachusetts, on June 9, 1920. Capt. A. Henry Higginson of South Lincoln, Massachusetts, was elected president for the ensuing year; vice-presidents, Percival Roberts, Jr., Narbeth, Pennsylvania, John Linn, Manhattan, Kansas, J. Henry Meyer, San Francisco, and Hugh J. Chisholm, Port Chester, New York; secretary-treasurer, J. G. Watson, Brandon, Vermont; directors for a period of three years, Geo. E. Pike, Gouverneur, New York, W. T. Tonner, Torresdale, Pennsylvania, R. L. Knight, Hope, Rhode Island, M. A. Towle, Boston, Massachusetts, Geo. McFadden, Rosemont, Pennsylvania, H. W. Gossard, Chicago, Illinois, J. Henry Stewart, Bath, New York, and John R. Valentine, Bryn Mawr, Pennsylvania. W. P. Schanck of Avon, New York, was elected to the board of directors to fill vacancy caused by election of Capt. A. Henry Higginson to presidency. A. H. Sagendorph, Spencer, Massachusetts, (chairman), Stephen Bull, Racine, Wisconsin, John R. Valentine, Bryn Mawr, Pennsylvania, L. W. Newton, Ashburnham, Massachusetts, and W. P. Schanck, Avon, New York, were elected executive committee by board of directors.

NATIONAL AYRSHIRE SALE

The second national Ayrshire sale was held at Springfield, Mass., on June 10 and drew a large and representative attendance. Forty-four head sold for a total of $42,490, or an average of $965. Henderson's Betty, a mature cow, topped the sale at $4,100, being purchased by Peter Bradley, Weymouth Farms, North Weymouth, Massachusetts.

BETTER SIRES TO APPEAR IN MOVIES

The department of agriculture is preparing a series of motion pictures and stereopticon slides for use in the "Better Sires" campaign. The interest aroused among the breeders of the United States is taking the form of requests upon the department of agriculture for information which, it is hoped, the film feature will be able to satisfy. It is probable that the motion picture will be ready for issue next fall.

A PRESCRIPTION

If you are poor—work.

If you are rich—continue to work.

If you are burdened with seemingly unfair responsibilities—work.

If you are happy—keep right on working. Idleness gives room for doubts and fears.

If disappointments come—work.

If sorrow overwhelms you and loved ones seem not true—work.

If health is threatened—work.

When faith falters and reason fails—just work.

When dreams are shattered and hope seems dead—work. Work as if your life were in peril. It really is.

No matter what alls you—work. Work faithfully—work with faith.

Work is the greatest material remedy available.

Work will cure both mental and physical afflictions.—The Silent Partner.

DIFFERENCE OF OPINION

"What did you think of the senator's speech?" asked the low browed citizen.

"I thought it was rather tautological," replied the high browed person.

"Well, if it taught you anything that's more than it did for me."—Birmingham Age-Herald.

Veterinary

Sliver in Hock

Some three weeks ago one of our cows ran a two inch sliver in her left hind leg around the hock joint. We lanced it and got the splinter out. It drained well and healed. Then after a week or ten days she was unable to put that foot to the ground. I rubbed the leg with some liniment, with no results; also made a slight incision to see if any pus was there, but found none. She is due to be fresh this week. She fell down on her milk after being injured, so we dried her up, as the milk seemed to be full of long, white, stringy matter. If you can tell me what to do, will be very grateful.—Subscriber, Newhall.

It is rather difficult from the information available to determine the exact cause of the trouble which prevents your cow from putting her foot to the ground. If you are sure that no other trouble has arisen with the foot or any other portion of the leg, it would then seem possible that a portion of the sliver which was run into the leg near the hock joint was not all removed. This sliver may have migrated to some other portion of the leg where it is causing the trouble. I would suggest that you examine the leg carefully to determine if any portion of the leg is sensitive and would look for the trouble in that part. The trouble in the milk may be attributed to the fact that the animal was probably feverish, due to the above mentioned difficulty. If you cannot determine the trouble yourself from a closer examination, it would perhaps be desirable for you to consult a veterinarian that could give the animal an examination.—G. E. G.

CANADIAN WHEAT PRICES

The value to farmers of being strongly organized is very nicely illustrated by the experience of the Canadian farmers in selling their wheat.

In Canada, as in the United States, the government took control of the wheat. In Canada, however, organized farmers were given representation on the control board. The Canadian farmers had competent men to represent them on this board—men who really understood the game. The minimum price of wheat was fixed for the year 1919 at $2.15, and this was paid in cash when the farmer delivered the wheat to the elevator. At the same time he received his check he was given also a participation certificate, which showed the number of bushels of wheat he had sold at $2.15 and which indicated his right to participate in profits over and above this minimum price.

The wheat board was able to sell the wheat considerably above the minimum price. Mr. Lambert, the secretary of the Canadian council of agriture, told us recently that these participation certificates given to the farmers would be worth between 50 and 60 cents a bushel. That is, the farmer got an original price of $2.15 in cash at the time of delivery, and now he will be able to cash in his participation certificates for an additional price of between 50 and 60 cents for every bushel of wheat he sold. Mr. Lambert said the certificates might be worth even more than the figure he indicated. That means that the farmers of Canada will get between 90 and 100 million dollars more for their 1919 wheat crop than the minimum price of $2.15.

The farmers of the United States sold their wheat on the basis of $2.26 per bushel. They got no participation certificates. Whatever profit above the minimum price was made on the wheat grown in the United States was made by some one other than the producers.

This is a very fine illustration of the efficiency of a real farmers' organization.

RHUBARB---Wagner's Giant Plant Now

July is one of the best months to plant. Growers who planted last July and August have already harvested over 15 tons per acre netting $1,000 eleven months from planting. For further information write J. B. WAGNER, Rhubarb Specialist, 1550 East Villa St., Pasadena, California.

Value of Soil Analysis in Determining Fertilizer Needs

By Myron R. Harris

It is sometimes well for those of us who are engaged in the fierce fight of producing successful crops to halt a moment and look at the elementary or academic side of some of the questions whose solution is vital to our success. So we are glad to give a very short extract from thesis of a young man who has made a special study of soil questions in the California college of agriculture. Myron R. Harris, member of Dr. Coit's citriculture classes, has made extensive study of the question of Fertilization of Citrus Crops. So long as the matter of soil analysis has been so generally misunderstood, we quote from his manuscripts as to analysis and the value of knowledge in determining the necessary fertilizer elements, both inorganic and organic.

THE subject of citrus fertilization is one which has been much discussed but about which there has been little accurate knowledge. The systems in use by growers vary between the widest limits. There is a tendency often for a man to get started on one method of fertilization and stick to it whether good or bad results are obtained. He rides his hobby to death. This naturally retards advancement of knowledge.

It is becoming better and better understood that more is necessary than the mere addition of the plant food elements to the soil in the amounts taken out by the crop or crops. It has been found that the state in which the elements are present and the condition of the soil itself are as important and even more important than the actual amounts.

It was believed at one time that the fertilization of a soil could be determined by chemical analysis; that a sample of soil could be sent to a chemist and from its analysis could be determined the amount of each fertilizing element present and the amounts of each which should be applied

Various methods of extraction were used Solvents tried out were strong hydrochloric acid, dilute hydrochloric acid, carbonic acid and distilled water. It was attempted to use solvents that would take out just those elements and the same amounts that the natural soil solution would contain. It was found impossible, however, to exactly duplicate it. Recourse has been had to physical methods of extracting the soil solution itself by a centrifuge and by means of pressure, but these were unsatisfactory, giving abnormal soil conditions.

The actual amounts of plant foods are not so important as the state in which they are present. They may be present in any one of three states: soluble and available for the plant immediately; insoluble and not available but easily and quickly changed into an available form; and unavailable form from which a change is a slow process—a state of storage.

Inorganic Soil Constituents

The soil is largely made up of elements which are not necessary to support plant life. Oxygen, silicon and aluminum make up over 83 per cent of the rock constituents from which the soil is formed. Calcium is the necessary element occurring in the largest amounts, 3.5 per cent. Potassium comes next with 2.3 per cent, and phosphorus next with less than one per cent.

Calcium occurs mostly as calcium carbonate and to a much less extent as the nitrate, phosphate, sulphate and complex silicates. It ranges from less than one per cent to over 50 per cent. There should generally be more than one per cent present for crops. Coarse sands, peats and clays are often deficient in lime.

Lime is not a fertilizer element in the strict sense of the word. Its great function is improving the physical condition of the soil, neutralizing acid soil and increasing the availability of the other elements.

Potassium in available form is present as the sulphate, chloride and nitrate. It is also in the soil as complex silicates. The minimum for a good soil is two per cent; it is highest generally in fine clay soils. In alkali soils it has been known to be as high as 17 per cent. This element is not easily removed by leaching.

Phosphorus is present only in very small amounts. A total content of 0.25 per cent is very good, the usual amount being between 0.11 and 0.03 per cent. Of this only a part is available. It is generally present as phosphates of calcium, iron, magnesium and aluminum. The iron and aluminum compounds are insoluble and unavailable. Tri-calcium phosphate is more readily available. The presence in considerable amounts of iron and aluminum compounds causes the formation from phosphorus fertilizers of iron and aluminum phosphates unless considerable lime is present. Soluble phosphates are not removed to any great extent by leaching.

Organic matter is present also in the soil to a greater or less extent. Its presence is due to accumulations from native vegetation and from animal remains, and in agricultural soils from the leaves, stems and roots of crops, green manures, farm manures, and various waste animal and plant materials.

This material is found, then in the soil in all stages of decay, from the fresh, unchanged forms to a dark, structureless mass of humus.

It is of great importance in the soil, since it is a source of plant food, facilitates necessary chemical reactions in the formation of other plant foods, improves the physical condition of the soil, and on the other hand may result in the presence of plant poisons.

This vegetable and animal matter contains, besides a small amount of inorganic salts of calcium, magnesium and potassium, and some carbonates, sulphates and phosphates, organic compounds of two kinds. These are nitrogen free compounds which make up the greater part and consist of carbohydrates, fats, oils and organic acids; and a much smaller amount of nitrogen compounds containing nitrogen, sulphur and phosphorus, besides carbon, hydrogen and oxygen.

These organic materials decompose more or less rapidly in the soil according to their composition and the condition of the soil. In the presence of air they slowly oxidize, finally disappearing entirely except for the mineral residue. This action takes place more rapidly in light, well drained and well aerated soil, especially so in a warm, dry cimate, than in wet, heavy soil. In the absence of air only partial decomposition takes place, and that at a very slow rate. The most easiy decomposed parts decompose first. The hydrogen and oxygen go off much faster than carbon and nitrogen, resulting in the accumulation of these elements. The nitrogen passes into insoluble forms which are less available as plant food. The names applied to the various stages in the decomposition are: leafmold, the half decomposed material, and humus, a more advanced stage in the decay. Peat is an early stage of decomposition in the absence of air, usually under water and at considerable depths. Further decomposition may have been stopped by the accumulation of acid which killed the decay organisms. The plant food contained in peat is not in an available form. Muck is a more advanced stage in the decomposition than peat, showing much less of plant structure and containing plant food somewhat more available than that of peat.

The organic matter in the soil is of considerable importance in the chemical reactions in the soil which make the plant foods available. Its effect is shown in the following ways:

Insoluble forms of potash are changed into available forms as nitrates, carbonates and organic compounds.

Insoluble forms of phosphorus are changed into soluble forms.

The organic matter reacts with calcium and magnesium to form insoluble compounds preventing the loss of organic matter by leaching.

Nitric acid combines with alkali metals to form nitrates.

Carbon dioxide in water aids in the solution of various elements and making them available.

Due to the preponderance of carbohydrates in plants and of nitrogen compounds in animal manures, the former tends to make the soil acid and the latter to make it alkaline. Nitric acid is formed from the latter in the later stages of decomposition, but is used so quickly by the plant that it has little permanent effect in making the soil acid. It has more effect in dissolving insoluble potassium and phosphorus compounds than the weak organic acids from carbohydrates which are not considered as plant foods. Carbohydrates, on the other hand, have more permanent effect on the soil.

Basic compounds are necessary in the soil. Those commonly found in soils are calcium carbonate and smaller amounts of magnesium carbonate, besides the carbonate, oxides and hydroxides of iron. These neutralize acidity and when they are used up the soil becomes acid or sour. In this condition the necessary reactions do not take place as they should, oxidation of nitrogen is hindered, the bacteria in legumes are inhibited, the basic compounds facilitate the changing of materials into available forms for plants and improve the soil's physical condition.

Cross-Inoculation of Legumes

In "Soil Science" Koch and Butler suggest that when a mixture of various Leguminosae seeds is sown it is of great practical value to know to what extent a crop containing a single variety of root nodule microorganisms is capable of inoculating all the different seeds simultaneously—in other words, if the root microorganisms of one species of Leguminosae can be inoculated satisfactorily into another species (cross-inoculation).

To throw light on this question a series of cross-inoculation experiments was made with the following four groups of Leguminosae.

Alfalfa group, including cultivated alfalfa (Medicago sativa), bur clover (Medicago denticulata and Medicago maculata), and sweet clover (Melilotus alba).

Clover group, including four clovers —crimson, alsike, red and white (Trifolium incarnatum, T. hybridum, T. repens, and T. pratense).

Pea-vetch group, including the garden pea (Pisum sativum), Canadian field pea (Pisum arvense).

Cowpea group, including the cowpea (Vigna Catjang), Japan clover (Lespedeza striata), and the velvet bean (Mucuna pruriens).

Results

Bacillus radicicola, isolated from roots of alfalfa, bur clover, and sweet clover respectively, is adapted to cross-inoculation, but the microorganisms of alfalfa and sweet clover only infected the roots of bur clover very slightly.

The micro-organisms isolated from the four clovers caused, when cross-inoculated, nodules as vigorous as those obtained by direct inoculation on the original plant.

The microorganisms of the four plants of the pea-vetch group respectively may be used for cross-inoculation. In the garden pea and the field pea, however, the nodules produced by cross-inoculation were not so vigorous as those caused by direct inoculation of the specific organism.

In the cowpea group cross-inoculation produced nodules in each case except when Japan clover was inoculated with the microorganisms of the cowpea. In all cases the roots of Japan clover produced few nodules.

ALFALFA AND COTTON INCREASE IN SALT RIVER VALLEY

The annual report of the Salt River Valley Water Users Association, covering lands under the project which represents about two-thirds of the acreage in Maricopa County, or one-third of the entire acreage in the state, shows that the acreage of alfalfa has decreased from 65,000 to 25,000 last year and that the cotton acreage has increased from 66,000 to 140,000. There is a marked decrease in the acreage of grain also. While there has been a decrease in the number of dairy and beef cattle there has been a considerable increase in the number of silos. The number now on the project is 379, with a capacity of 33,407 tons.

STORING SEED POTATOES

In a recent report on a series of experiments it is stated that potatoes generally lose from ten to 16 per cent of their weight when preserved, and the tubers germinate for a long time before it is possible to plant them. The author attempted to discover what factors might be applied in order to reduce the loss in weight and retard germination, and found them to be the temperature, oxygen supply, and the moisture of the air.

At a temperature of 8.82 degrees Centigrade the loss in weight of potatoes increases rapidly with the number of days they are preserved, but at a temperature of 3.74 degrees Centigrade the loss in weight practically ceases after the 120th day. This may be attributed to the fact that the starch is rapidly hydrolysed when the temperature sinks below eight degrees Centigrade, thus compensating more or less largely for the losses in weight due to transpiration and respiration by gains in weight resulting from the accumulation of sugar. From the point of view of loss in weight it is, therefore, advantageous to store seed potatoes at a low temperature.

Both an excessively saturated and an excessively dry atmosphere must be avoided, the first because it induces too intense a transpiration, the second because it causes the vapor to condense on the surface of the tuber, thus favoring the development of molds.

PLOWSOLES

In the citrus orchards of Southern California where the soil is cultivated during the irrigation period, a plowsole forms immediately beneath the plowed soil. The depth of this layer may vary from a few inches to two feet, but is rarely more than 18 inches below the surface. The hardness varies from that of a crust to that of a layer difficult to break with a spade. Immediately after irrigation the plowsole is usually soft enough to break easily, but becomes hard as it dries.

Plowsoles form during the irrigation season. They do not, however, form in mulched soils which are rarely plowed, and pressure from the plows and tools does not appear to be necessary to their formation. As plowsoles limit the growth of the roots and prevent the penetration of the irrigation water, it is important to control them. To overcome the plowsoles mechanically a subsoiler is used. Chemical action is induced by applying ground lime, ground sulphur and gypsum. The introduction of organic matter deep down in the soil is undoubtedly the best deterrent to formation of plowsole.

IMMUNE WOODEN PILING

As ornamentals we of California have grown several species of a conifer with real leaves (not "needles"), known as podocarpus. The one most common with us in P. macrophylla, often passing as P. Japonica through being native to Japan. It is a very slow growing tree, but eventually attains to 50 feet. There are other faster growing species, and two of these, P. elongata and P. tracilier, from Africa, are recommended for many uses. A government report states:

"The wood is very even grained, with few knots. Builders in South Africa are fully conversant with its qualities for house construction work, such as flooring and lining boards. It also makes good railway sleepers and construction timbers when creosoted. Timber merchants anticipate a great future for it. A firm of railway and dock constructors reported as follows after using this timber on harbor works at Kilindini: To test whether this timber is affected by teredo, a log was moored to float under the false work of the pier. It was left there for a year and then found perfectly sound and good, whereas the baulks of the false work of pitch pine were quite eaten through by teredo in the same time."

VALUE OF FARM MANURE

In the Journal of Agricultural Research C. S. Scofield gives the results of interesting experiments on the effect of farm manure in stimulating the yields of irrigated field crops.

The experiments described were carried out in three stations with irrigated soil under semi-arid climatic conditions in order to study the effect of farmyard manure on the production and quality of sugar beets and potatoes. The experiments lasted six years, from 1912 to 1917, in rotations of two to six years with oats and alfalfa. The manure was applied at the rate of 12 tons an acre for each rotation.

The application of manure to potatoes increased the crop by about 40 bushels an acre and at the same time raised the proportion of marketable potatoes by eight per cent. The yield of sugar beets was also raised by 4.3 tons without any appreciable increase in the percentage of sugar. In five out of seven rotations the manure was applied to the experimental crop, and in two others to the preceding crop. In both cases the beneficial action of the manure is appreciable for two years or more after its application, both for the crops studied and for the other rotation crops.

AGRICULTURAL TRAINING IN ARIZONA

Arizona students of agriculture under the vocational agricultural training work are cultivating a total of 774 acres of different kinds of crops and are caring for 168 head of live-stock, 488 chickens and 272 stands of bees. Carey Bowles, supervisor of agriculture of the state department of vacational education, says: "The projects which go to make up these totals are distriuted over seven of Arizona's 14 counties. They represent the practical application of vocational agricultural instruction in 16 schools. All project work is done under the supervision of local teachers of agriculture who are employed for 12 months of the year. A complete set of records and accounts is kept for each project, and at the end of the crop year the boys will know the exact amount of their profit or loss after rent, labor, and other operating expenses have been paid."

FAIR DATES

Sonoma County Fair, Santa Rosa, August 25-29. Secretary J. Francis O'Connor.
Patterson Fair, Patterson, August 26-28. Secretary T. J. Moe.

Western Royal Livestock Show, Spokane, Washington, November 1-5. Secretary Bert L. Hilborn.
Pacific International Livestock Show, Portland, Oregon, November 15-19.

NITROGEN IN SOILS

Recent experiments were made in Kansas to determine the nitrogen content of soils in old alfalfa fields as compared with soils continually cropped and those in native sod. Alfalfa fields contained 30 per cent more than cropped soils and 15 per cent more than native sod soils. The report states: "The increased crop production which is usually obtained on alfalfa fields when they are plowed up is probably due to the large amount of available nitrogen they contain."

The National Research Council organized at the beginning of the war under the auspices of the National Academy of Sciences in order to mobilize the scientific resources of America for work on war problems has now been organized and will now cooperate with the scientific bureaus in investigating the resources of this country. It is now endowed with $5,000,000 by the Carnegie corporation.

TRY THE RED SEAL SPARKER

A Gang of "Red Seals" Handled as One

Your same trusted friends—the Red Seal Dry Batteries—but easier now to handle. Ready for you now at your dealers.

Red Seal Sparkers do away with bother and loss of time in fussing with short wires and many connections—of short circuits in connecting wires—of handling an awkward bundle of batteries, etc. New double waterproof casing lengthens battery life. Only two posts to connect—large and square to turn easily with fingers. A broad web strap for carrying from one job to another—from Ford to tractor, farm engine or to lighting plant at night.

Best for Every Farm Use

Wherever a spark is needed, the Red Seal Sparker will serve you best. Handiest thing in the battery line you ever saw — and Red Seal sterling quality all through.

Ask You Dealer

Dealers handling Red Seal Dry batteries also have the Sparker. Buy the Sparker for its convenience and saving. Your dealer has "How to Run the Gas Engine—Simplified"—our famous hand-book for engine owners. Ask him for Free Copy.

POULTRY

BROODERS

We are offering to the California public the Reliable Blue Flame Brooder. It has a capacity of one thousand chicks. Burns one gallon of common kerosene oil in twenty-four hours, without gas, soot or odor. The most perfect brooding device yet placed on the market. In use, and indorsed by the Oregon Agricultural College, and the Western Washington Experiment Station, and two hundred other satisfied users in and around Seattle. We are western distributors. Have some good territory open. Write for circular. Queen Hatchery, 89 Pike Street, Seattle, Washington.

BABY CHICKS

PAINTS

Roof Leaks Stopped Quickly, permanently. Our guaranteed roof paint and cement, ready for use, does not settle, thinning unnecessary. Exclusive territory to dependable dealers considered. Dept. 38, Martinek Paint Co., 405 Lexington Avenue, New York City.

HOME CANNING NECESSARY THIS YEAR

Home canning—of utmost importance during the war—will be just as important this year, according to present indications as they are viewed by the United States department of agriculture. The shortage of labor on the farms makes it necessary for the canneries to pay high prices for the commodities that will be canned later in the season. Labor in the canning factories is expensive and difficult to obtain. Everything, from cans to cartage costs, has increased in price, and transportation is slow and more expensive than it was in war times. All this increase must be paid by the ultimate consumer, and there is not even assurance that there will be enough canned products to go around. The solution is home canning.

That sugar is higher in price than it has been hitherto is advanced by some as a reason for canning either less fruit or nothing but vegetables; but unless one intends to give up sweets altogether there seems no good reason for not using canned fruit on account of high priced sugar. There are few desserts that do not take from one-half to one cup of sugar, and no dessert is more healthful than fruit. It is not necessary to use such thick syrup as was used in the days of plenty. A ten per cent syrup made of one part sugar and nine parts water will make palatable any of the acid fruits Such fruits as apples, pineapples and the like can be canned without sugar In fact, ordinary glucose or corn syrup may be substituted for sugar in making the syrup. A palatable syrup is made by mixing one-half cup sugar, one cup glucose and eight cups of water.

It requires about seven ounces of sugar for a pint jar. One cup of sugar will make ten cups of syrup. A pound of sugar will make 20 cups. This last amount will be sufficient for 20 pints of canned fruit. Where the ten per cent syrup is used the cost of the sugar to can a pint jar is one and one-half cents with sugar at 30 cents a pound. It is not so expensive after all.

YOU FURNISH YOUR OWN MATERIAL

There were stories told at the annual meeting of the Travelers Aid meeting at the Princess Theater the other day that were too good to be lost. One by President S. I. Cox of the Silk Travelers Association is specially interesting in these days when everyone seems to be thinking more or less of the life hereafter. Someone had gone to the pastor of Mr. Cox's church to ask his idea of heaven and in answer he related a dream told him by another member of the church, a man of prominence and high financial standing. This gentleman in his dream had died, reached the gates of heaven, was admitted and courteously taken on a personally conducted tour through the pearly streets of the country now to be his home. A number of houses were in process of construction, and a large one was pointed out as being the future home of the man who on earth had been the new arrival's gardener.

"For my gardener!" exclaimed the gentleman in surprise. "Why, on earth he lived in such a small house! He needn't have done so, of course, but he never had anything; he gave everything away. He lived in the little lodge at the entrance to my grounds."

The guide assented to the truth of this statement and the personally conducted tour was continued until they came to another house in process of erection, so small that the new arrival asked curiously for whom it was intended, and was amazed upon being told that that was to be his own home.

"I am to live in that little place, when on earth I had such a great house!" he exclaimed.

"Yes," said the guide, "but you see here we have to use the materials we have on hand, and when you were on earth you sent very little over."

STARLING MOCKED SPARROWS

The sense of humor is usually regarded as exclusively human. But I am not sure that it is, writes "L. F." Yesterday I was privy to an incident in the bird world which raises doubts Perched on a plane tree in Kensington gardens was a starling occupied in turning over his wet and disheveled feathers in the sun, for he had been bathing in the Serpentine. Presently a party of sparrows near by began a noisy dispute—keeping up the sort of shrill cheep-cheep-cheep that one associates with the housetop at five oclock in the morning. This starling at once left off his laundry work and listened, with his head comically tossed so far back that his yellow bill pointed skyward. Then he executed a little warble—in a couple of bars, subdued and sweet. But the next instant, opening his bill to its widest gape, he broke out into that same shrill, five-in-the-morning cheep-cheep-cheep. Then he returned to his feathers.

The sparrows persisted. Again the head was thrown back and the mockery repeated. Again and again it was done, each imitation, curiously enough, being prefaced by the melodious little prelude. So exactly was the sparrows' chirp mimicked—in pitch, volume, timbre and rhythm—as to be quite indistinguishable from the original. If the starling has not the sense of humor, he appears at least to have a nice sense of the ridiculous that lies in mimicry.—Manchester Guardian.

The man who seems to know most about the problem of capital and labor and to do most of the talking about it is the one who never had any capital and never would labor.

The Balance of Rations

Your hens are literally an "egg machine" and the correct feeding furnishes the raw material for eggs. Into this feed LACTEIN should enter, as it furnishes the balance to the food—and it furnishes the nourishment for the egg-producing organs—keeps the body in firm flesh and keeps the organs clean and healthy. LACTIC ACID, which is developed to the highest degree in LACTEIN, is of great assistance in assimilation and digestion of food—it enables the laying hen to get every morsel of nourishment from the feed.

Lactein

CONDENSED BUTTERMILK

also furnishes a great share of Protein for the white and fat for the yolk of the egg—LACTEIN brings the hens through the moulting season earlier, and it also causes pullets to begin laying earlier.

GIVE YOUR FLOCK THE BALANCE OF LACTEIN

Start now with this pure food and tonic for poultry and hogs. It represents an investment of real profit.

Picking the Layers by Elimination

By Jean A. Koethen

HOW shall we detect with certainty the heavy producing hen? The trapnest will do it, but not every poultryman is in a position to trapnest. There are many who have not the time themselves and do not feel justified in hiring the necessary labor for watching trapnests. Is there any way of finding the layers without trapnesting?

A good many men are working on this problem, and some of our young men especially are putting a good deal of time and study upon it. If in any flock we can put our finger on the high producer, the rest is easy, for like produces like.

Eggs and Walnuts

Fifty Dollars' worth of walnuts came from the trees in these yards. Photo by Mrs. Koethen.

One young man who has worked out a definite and ingenious system of picking the layers is B. S. Smallwood of the Mountain Ranch at Upland. A description of his methods will, I am sure, be of great interest just now, at the beginning of the culling season.

All the Mountain Ranch pullets are put in one house at the beginning of the season, and from the start all sick and defective birds are removed as soon as they are seen. This leaves a flock of vigorous birds to begin on.

Broodies First

Last year Mr. Smallwood began with a flock of 1,600 pullets. By the end of the year he had culled it down to 650 layers.

Obviously, the first hens to be gotten rid of in any flock are those addicted to broodiness. Broodiness can be condoned in Rocks and Reds, but not in Leghorns. No Leghorn that goes broody ever makes a very high record. In this flock every hen that goes broody before July 1 is removed and sent to market. The mere fact that she has gone broody is sufficient. If a pullet does not go broody till after July 1 it is plain that broodiness will never greatly affect her egg record, and she is left in the flock, but in the lowest grade—every pullet that has not gone broody by July 1 is banded on the left leg. This is the first step in Mr. Smallwood's system of banding. A different color is selected for each year's bands, so that he may see at a glance in what year the pullet was hatched and whether or not she has ever gone broody. A pullet without a band is therefore under suspicion. She has gone broody once, and she may go broody again. The pullets that receive bands July 1 are promoted into the lowest breeding pen.

Watch the Comb

It is assumed that every pullet is laying by December 1. Most of them are laying considerably earlier than this, according to the date of hatching. Mr. Smallwood prefers that they should not lay under six months of age, but they are hatched early enough to make it certain that every pullet with a capacity for heavy production is laying by December. After December 1 every pullet that stops laying is removed and marketed. How does he know that she has stopped laying? Here is the secret of the success of many men who have bred up heavy laying flocks. He visits the roosts at night with a lantern and picks out every hen with a wilted comb. To make assurance doubly sure he feels the pelvic bones, but the comb usually tells the tale. In nearly every case the wilted or dry looking comb is accompanied by pelvic bones too close together to permit an egg to pass between them. If at least three fingers cannot be placed between these bones it is evident that the hen is not doing much laying. This is a new way of playing the old game of "counting out." It is, "one, two three, out goes she," and the hen that quits, like the hen that goes broody is discarded forthwith. Every week one of these night visits is made to the hen house and every week the discarded hens are sent to market.

"Too heroic," do you say, this summary treatment of laggards? Not a bit of it. Feed is too expensive and time too valuable to permit the waste of either. The hen that stops in the middle of the season will not be in haste to begin again. Let her go.

By this constant elimination of the unfit Mr. Smallwood keeps his percentage of production steady at from 50 to 70 per cent. In the spring he expects it to be better than 60 per cent and he does not care to have it go much higher. A hen that lays from 75 to 80 per cent loses her surplus fat and with it her vigor and will be an easy prey to disease. The amount of hard grain fed from day to day is a sort of regulating screw to keep production steady. When it goes too high more grain is fed and less mash. When it runs low the amount of mash is increased and the grain feed diminished.

Trapnesting the Layers

Trapnest makes work, but picks out the layers and gives away the loafers.

Grading by the Molt

Every hen that stops laying before September 1 is removed and marketed. In July the roosts are visited again with a lantern and every hen that has commenced to molt is removed. This system of elimination is very largely a molting test. The early molter, like the broody, is one of the unfit, and out she goes.

After September 1 all hens regardless of age are kept another year unless they have gone broody. Broodiness is the unpardonable sin. After all this culling the flock that remains September 1 consists exclusively of hens that are laying. Early molters are gone; broodies are gone; the sick are always removed promptly.

On October 1 Mr. Smallwood and his helper go through the flock again and separate the pullets that are laying from those that are not laying. The hens that stop laying in September stop because they have commenced to molt. These hens are not discarded. They are kept, but marked. The pullets that have stopped laying in September are banded on the right leg. Those that are still laying are banded on the left leg. Do you see the point? The pullets with right leg bands are pullets that have stood several tests but that have molted too early to belong to the highest grade. The pullets with left bands now have two on the same leg, one to show that they did not go broody before July 1 and one to show that they were still laying October 1.

November 1 the flock is combed again, the pullets that are still laying November I get a band on both legs. These are what Mr. Smallwood calls "Long Distance Layers." They have laid since they began a year ago or longer, without stopping. Some of these hens lay 16 months or more without stopping—in fact, there were hens in the flock in April, 1920, that had been laying since December 1, 1918, without any perceptible molt. They were rusty and ragged, but still alert. When such hens do molt, it is usually a feather at a time and does not interfere greatly with production.

The hens are now segregated into three grades; those that laid nine months without stopping; those that laid ten months, and those that laid 11 months. The hens that laid 11 months before they began to molt are in the highest grade. Eighty-eight hens, ranging in age from one and one-half to three years, are in this grade, and the day I was there they laid 65 eggs.

This culling and banding looks like a good deal of work, but I was assured it is not. "We only handle the hens twice," said Mr. Smallwood, "on October 1 and November 1," and only our best hens. Early molters have already been eliminated or marked, and the number eligible to the rank of breeders has been greatly reduced."

When new blood is to be introduced the pullets are proved by the above method, and the best, when they are yearling hens, are mated to the best cockerels from the flock and used in the cockerel breeding pen.

Double Yarding.

A very satisfactory system of double yards has been in use for several years on the Mountain Ranch. The space in front of the long houses is divided into two yards and that in the rear remains one. These yards are planted in alternation to barley and Sudan grass, the barley being used in winter and the Sudan in summer. The birds are not turned on either crop till it has grown to its full height and been cut for feeding three or four times. Then they are turned on, not for green feed, for there is not much left, and it would not last if there were, but to get the benefit to be derived from clean soil. The purpose of this cropping is two fold: first, to purify the soil, and second, to use the manure in the soil for growing green feed.

GLOBE "A1" FEEDS

Judge them on Business Principles!

FEED FOR SWINE, STOCK AND POULTRY

ASK YOUR DEALER

Cement Droppings Boards

Mr. Smallwood says he is the first man in Southern California to use cement droppings boards. The cement is put on over the old wooden droppings boards, with a layer of waterproof building paper between. Cement is spread on the paper to a depth of from three-quarters of an inch to an inch. The cement does not warp nor crack and is easier to keep clean than wooden boards. All houses have cement floors.

To Control Toe Picking

The sight of the hundreds of chicks in the long brooder house reminded me of that oft repeated query, "How shall we control toe picking in young Leghorns?" On this ranch it is controlled by not allowing the sun to shine directly on the floor of the brooder house. The house fronts east so that it gets the direct sun only in the early morning, and the straw litter is always in the shade. The first week the chicks are kept in out of the outside run, and by the time they get out their shining toes have no longer any attraction. In some cases toe picking may be due to lack of salt. If the chicks show any disposition to indulge in the practice salt is added to the mash and a little salt pork is hung up in the run for them to peck at.

Teaching Returned Soldiers

A very interesting part of Mr. Smallwood's work, and something of which there may be more to be said later, is his class in poultry culture at Chaffey high school—or is it Chaffey agricultural college? In this class of 14 there are 12 soldier boys—lads of a little past 20—who are receiving vocational training at the hands of the government. These young fellows, broken in health but anxious to qualify for earning an outdoor living, are studying Harry Lewis' "Progressive Poultry Husbandry," and visiting poultry ranches under Mr. Smallwood's guidance, and he counts it a privilege to turn their thoughts into such a practical channel.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, June 7, 1920. Report for the week ending June 4, 1920.

The Leghorns in the laying contest at Storrs are coming into their own. In the thirty-first week a pen of Blacks entered by F. A. Brizzee, Oswego, Pennsylvania, finished in first place with a yield of 59 eggs. Two pens of Whites owned by Hollywood Farm, Hollywood, Washington, and C. Rasmussen from Dover, New Jersey, tied for second place with 58 eggs each. Barred Rocks that have been leading the contest for so many weeks managed to squeeze into third place, but this is the only mention they get. It was Oneck Farm's pen from Westhampton Beach, Long Island, that laid 56 eggs. The total production for all pens was 4,188 eggs, or a yield of nearly 60 per cent.

Higher egg prices seem almost inevitable. Feed and labor are two big factors in the cost of egg production, and both of these are at present higher in price than during the war. It would therefore appear that the poultryman must get more money for his eggs or else reduce the cost by getting more eggs per hen. From time to time there have been made in these columns several suggestions which ought to make for better egg production. A partial summary of those factors that can be almost entirely controlled by the poultryman includes segregation of the males after the hatching season, providing an abundance of green food in summer as well as in winter, a close inspection of the poultry houses to guard against red mites, making sure that the birds have a bountiful supply of clean, fresh water; all of which are an aid in getting the maximum number of eggs from any given flock of hens. A great many hens in Connecticut are laying around eight or nine dozen eggs a year, and this is not enough. The successful poultryman will have to get at least two or three more eggs a month, which would mean ten to 11 dozen eggs a year, on the average from each hen.

The three best pens in each of the principal varieties are as follows:

Plymouth Rocks

Jules F. Francais (Barred), 1,317; Oneck Farm (Barred), 1.290; Merritt M. Clark (Barred), 1,186.

White Wyandottes

Mrs. R. W. Stevens, 1,085; Herbert L. Warren, 1,058; Applecrest Farm Company, 1,033.

Rhode Island Reds

Pinecrest Orchards, 1,308; Jacob E. Jansen, 1,171; Charles H. Lane, 1,156.

White Leghorns

George Phillips, 1,260; Glenhope Farm, 1,233; E. A. Ballard, 1,196.

Miscellaneous

A. L. Anderson (R. I. Whites), 1,198; A. E. Hampton (Black Leghorns), 1,165; H. P. Cloyes (Buff Wyandottes), 1,069.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

By Max Kortum

For the week ending June 12 the 340 contesting hens laid 1,397 eggs, or a production of 58.5 per cent.

High pens for the week are: Gibson, 53 eggs; Bellows, 53; Stalling, 51; Gibson, 49; Binney, 49; Barker, 48; Enterprise, 47; Rose, 47; Schlink, 46; Wood, 45; Gray, 45; Clark, 45.

DON'T EXPECT TOO MUCH FROM HATCHING EGGS

The poultryman who sells natching eggs is too often blamed for poor hatches. Aside from irregular management of the incubator, weather conditions during transit and the temperature in which eggs are kept before placing them in the machine may affect hatchability. Eggs will incubate in a temperature of 70 degrees. If they are subjected to that temperature for any length of time and subsequently brought into a cooler temperature before being placed in the incubator, dead germs are likely to result.

It is wise to figure conservatively on the results to expect. About five times as many eggs should be incubated as one expects to have mature pullets in the fall. After April 1 90 per cent fertility may be expected for Leghorn eggs and 80 per cent for the heavier breeds. A 60 per cent hatch of fertile eggs is a good one. About ten per cent of the chicks may be lost on range. Of the remainder there should be approximately an equal number of cockerels and pullets.

NO SOAP

George Horace Lorimer, the Philadelphia editor, has an almost insane hatred of the Bolsheviki, and at a dinner in Overbrook the other evening a lady said to him:

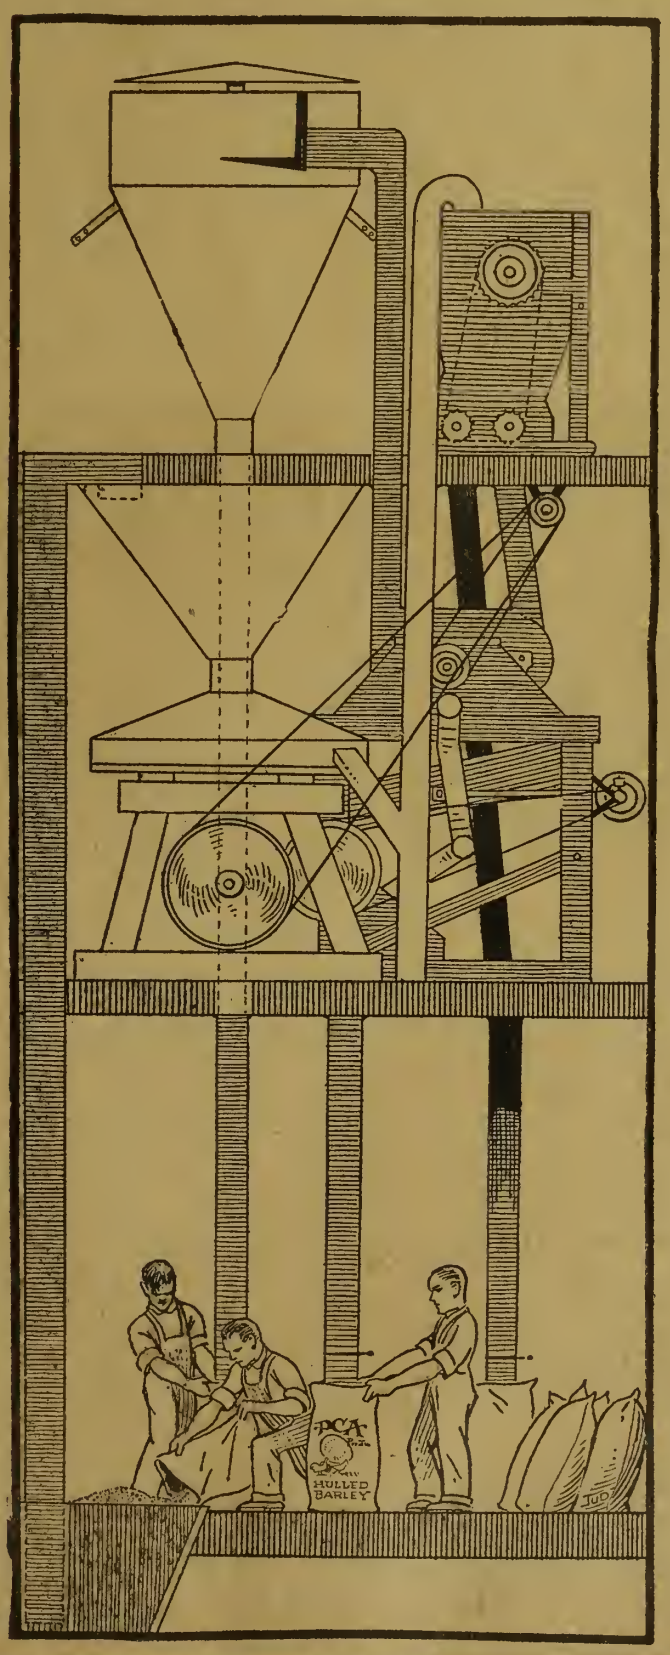
"I'm glad to see that you give the Bolsheviki the Old Harry in your paper. Some of these Bolshevikistic sheets make me sick. They are full of such wishy-washy talk about bolshevism."

"Wishy, perhaps, madam," said Lorimer, with a laugh, "but from the Bolsheviki habits, certainly not washy."

"My boy," said a father to his son, "treat everybody with politeness, even those who are rude to you; for remember, that you show courtesy to others, not because they are gentlemen, but because you are."—Our Dumb Animals.

This Great Machine Works

To Help Poultrymen



Present high prices of wheat with every indication of still further increases are awakening poultrymen to the value of hulled barley in feeding poultry.

The Poultrymen's Co-operative Milling Association has installed the latest type of barley hulling machine, a diagram of which is shown herewith. This machine—the largest of its kind in Los Angeles—renders more barley available as a lower cost poultry food and will help solve a difficult feeding problem.

PCA

Hulled Barley— An Economical Wheat Substitute

To compare favorably with wheat in nutriment the barley should be separated from the hulls by a special process, which will not grind off the valuable outer protein layers on the barley kernels. This process is effectually carried out by our new huller, so that P.C.A. hulled barley contains the maximum proportion of protein.

Poultrymen are urged to investigate the merits of hulled barley as a substantial poultry feed with the same values as wheat.

Ask your dealer for quotations on P.C.A. Hulled Barley, or write to us direct.

Price to producers: Hens, lt., 18; heavy, 24; broilers, 20@24; roasters, 38; old roosters, 14; fryers, 32; ducks, old, 17, ducklings, Pekin, 3½ up, 20; others, 17; geese, 25; turkeys, live, young tom, 44; dr., 50; old, live, 40; dr., 41; hens, live, 40; dr., 41; squabs, 45@47; pigeons, doz., 1.00.

Belgian hares, live, 16; old, 9.

LIVESTOCK

Los Angeles, June 22 — Weighed and delivered off cars without food or water:

Hogs (hard-grain, 125 to 175 lbs., 15.50; 175 to 225 lbs., 16.50.

Cattle (on foot, gross weight)—Steers, good, 11.00@11.50; medium, 10.50@11.00; cows, good, 9.00@9.50; medium, 8.50@9.00; bulls and stags, 6.00; calves, 125 to 150 lbs., 12.00; 175 to 225 lbs., 11.50.

Sheep—Ewes, 8.50@9.00; lambs, 14.50@15.00.

POTATOES AND ONIONS

Potatoes show slight decline during week. Commission houses have been willing to accept $1 lower price than a week ago.

These are the actual prices obtained between 7 and 8 o'clock, June 22 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk. There may be slight fluctuations during the day's trading.

Old stock: Practically no supplies; too few sales to establish market. New stock. Market unsettled. Local Early and White Rose No. 1's, mostly 2.40@2.75. No. 2's, 1.00@1.75 per lug, according to size; 100 lbs. sacked, No. 1's, 6.50@7.25.

Carlots: Supplies liberal. Market easier. Sales to jobbers: New stock: White Rose No. 1, sacked mostly 6.25@6.60 per cwt.; lugs, 2.25@2.40.

Onions: Supplies of Wax, heavy; Yellow, light; wide range in quality; some slippery; demand and movement slow; market steady. New stock: Coachella Valley: Wide range in prices. Bermudas, best, 1.25@1.50 per crate; lugs, 75@1.10. Crystal Whites, per crate, mostly 1.50; lugs, mostly 85@1.00; sunburned and decayed stock at all prices.

Carlots: Demand and movement slow; wide range in condition; many sunburned; market improving. Coachella Valley: Standard crates, Yellow Bermudas and Crystal Wax, sales to jobbers, best, 1.00@1.25; poorer low as 75.

Garlic: lb., 30@35.

VEGETABLES

These are the actual prices obtained June. 22 by the Los Angeles wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Doz., best, 60@80.

Asparagus: Supplies liberal. Market steady. Delta section: Best 12@15; local, 17@20.

Beans: Ky. Wonder, 6@9.

Beets: Doz., 45@55; sk., 2.25@2.50.

Cabbage: Supplies moderate, market steady, movement good, wide range in quality. Best mostly 2 per lb., per field crate, best, 1.75@2.25; poorer, low as 1.00.

Carlots: Demand pood; movement limited; market steady. Carloads, f. o. b., usual terms. Cannonball and Winningstadt, per ton, mixed cars, 30.00@40.00.

Carrots: doz.,40@50; sk., 2.50@2.75.

Corn: Local, 1.75@2.00 per box.

Cucumbers: Market steady; local, best, lug, 1.25@1.50.

Egg Plant: Best, lb., 8@15.

Lettuce: Supplies, moderate. Crates, best, 75@1.00.

Carlots: Few shipments, mostly on consignment; market steady. Few sales mixed cars; 1.50@1.75 per crate.

Parsnips: Lugs, 1.00@1.50; sacks, 3.00@3.25.

Peas: Northern: lb., 9@10.

Rhubarb: Strawberry, bx., 1.00@1.25.

Spinach: Doz., 20@30: lb., 2.

Squash: Local summer, large lugs, 60@80; flats, 50@60.

Tomatoes: Imperial and Coachella, supplies moderate; market steady; cr., best, 1.75@2.00.

Turnips: Per dozen, 30@40; per sack, 1.00@1.25.

DECIDUOUS FRUITS

These are the actual prices obtained June 22 by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk.

Apricots: Northern: 5@7; local lugs, 1.50@2.00.

Bananas, 10@11.

Blackberries: Supplies light; per crate, mostly 3.00@3.50.

Cantaloupes: Market strong; supplies light. Imperial Valley: Standard, mostly 4.50; Ponies, 3.75@4.00; flats mostly 1.75.

Carlots: (Direct wire from Brawley) Hauling heavy, increasing. Demand good, market steady, prices declining. Quality and condition fair to good. Carloads f. o. b. cash track. Standards, 45's, 3.00@3.50; mostly $3.25; ponys, 2.50@3.00; flats, 1.15@1.75, mostly 1.30@1.40. Yesterday's shipments, 240.

Cherries: Supplies liberal; market strong; various varieties, best, mostly 15@18 per lb.; poorer, low as 10.

Gooseberries: lb., 10@12.

Peaches: Supplies liberal, wide range in quality. Various varieties, lb., 5@10.

Raspberries: cr., 3.50@4.00.

Rhubarb: Local, 1.00@1.25 box.

Strawberries: cr., 3.50@4.00.

Watermelons: Supplies liberal. Mostly 2@3 per lb., according to size.

Carlots: (Imperial Valley section)—Demand and movement good; market firm. Carloads f. o. b. cash track, Brawley and El Centro; 32.50@40.00 per ton according to size and quality.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.25@2.75; special packed brands, 3.00@3.25.

Lemons: Market unsetled, wide range in prices. Local Stock: packed, 3.75@4.50; loose, 1.25@2.25.

Oranges: Supplies liberal. Valencias: packed special brands, 100's, 4.50@4.75; 126's, 5.00@5.25; 150's to 176's, 5.25@5.50. Local packed, 3.75@4.25.

HONEY

Old honey practically exhausted, new supply light; few sales; demand good; movement limited. Carloads f. o. b., usual terms. New crop orange, 21; Hawaiian lt. amber, 17½. Old crop white amber sage, 19; wh. alfalfa, 19½. Beeswax, 42.

HAY

Alfalfa Growers of California, under-date of June 23, says:

The market for alfalfa hay ruled strong this week under active demand for spot as well as for lots to be shipped. Sales would hape been larger if not been compelled to turn down offers for round lots, on account of having disposed of all that the members listed this week for sale at current prices.

Present prices appear decidedly reasonable considering cost of production, and still more so in view of the probable light total production in the state. A feature of this year's distribution is that on account of the larger requirements in the northern part of the state, where the shortage is most pronounced, a good deal of hay from sections in the San Joaquin Valley which formerly went to Southern California markets, is going north. Large shipments of grain hay and alfalfa have come into the southern market this week but prices have held strong on all high grades. The lower grades containing foreign grasses have sold off and the supply is limited. The millers of alfalfa meal are showing a disposition to buy good green alfalfa! Market as a whole strong.

Prices in California today are as follows in southern districts:

Choice alfalfa, 40.00 per ton, No. 1 dairy, 36.00; standard dairy, 32.00, stock alfalfa, 29.00.

GRAIN AND FEEDS

Barley: Stiff export demand has given great interest to barley movement. There is a great range in price because of vast difference in quality. Forty-nine lb. bright barley is readily commanding 3.30, while a 41 lb. barley, more or less stained, may run as low as 2.82½.

Milo: Good bright, local grown milo is commanding 3.20 and Eastern milo is running as low at 2.92@2.95.

Wheat: Utah-Idaho Milling, 6.00; feed wheat is running around 4.45@4.55.

Corn: Sacked, Yellow, 3.85@3.91¼.

Price bid local grain exch. cwt., June 22: Barley: 2.81¼@2.83¾. Milo: Carlots, 2.86¼; Eastern, 2.92½. Kafir: Eastern, 3.12½.

1919 crop, 85@1.00 per lb. Prices to growers for 1920 crop, 65@80 per lb.

HONEY

Reported by Rafael & Wing:

Very little honey arriving. Not enough sales to establish prices. White orange offering in this market at 20@21. No change in wax. It is bringing from 40 to 42. From all indications, there will be a very good honey crop from the San Joaquin and Sacramento valleys. The sage crop in Santa Clara and San Benito counties is practically a failure. Some Honolulu honey offering, but not enough to affect the market.

GRAIN

Wheat: No quotations obtainable.

Oats: Red feed, 3.15@3.25.

Corn: California Yellow, 3.70@3.80 per cental; Egyptian White, 4.00@4.10; California milo maize, 3.40@3.50.

Barley: No. 1 feed, 3.00@3.10.

HAY

Under date of June 19, A. W. Scott Co. says:

Receipts past week 1,598 tons. The market in San Francisco has ben extremely dull. Old hay practically cleaned up, probably never has the supply of old hay been so completely exhausted in California. Much of the supplies coming in here during the last week have been for export and for government contracts. New hay has not commenced to come in sufficient range or variety to fix stable quotations. Throughout the country there seems to be a fixed impression on the part of the farmer and determination to ask $30 per ton for almost any quality of grain hay. The prices asked are so far in excess of the ideas of the consumers here that they decline to purchase with the result that there is practically no trading done and may not be until conditions of supply and demand bring closer harmony of ideas. What purchasing of new hay has been done has only been from hand to mouth in cases where it was absolutely needed. Shipping conditions through the state are improving but still far from satisfactory, and it may be sometime yet before any regular service can be obtained. Dealers have made no purchases as yet of any consequence as the feeling seems to be that it is a little early to determine the amount of shortage in some sections and extra production in others. Much delay of baling is caused by scarcity of wire.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Old Hay:	
Fancy wheat hay (light 5 wire bales)	38.00@41.00
No. 1 Wheat and Wheat and Oat hay	35.00@38.00
No. 2 Wheat and Wheat and Oat hay	32.00@35.00
Choice Tame Oat hay	37.00@40.00
Wild Oat hay	Nominal
Other Tame Oat hay	33.00@37.00
Barley hay	Nominal

Citrus Markets

Los Angeles, June 23, 1920.

The orange market continues strong; some sales in auctions going above the $8 mark. Fresh deciduous fruits are filling the market but oranges are still in keen demand.

On the other hand the lemon market continues flat, first class stock being held in packing houses unless around 4.50 f. o. b. California may be had. Number foreigns available for market within next 30 days said to be in excess of 200,000 boxes.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 22,329 cars; lemons, 5,539; total, 27,868. To same date last season: Oranges, 26,009; lemons, 6,943; total, 32,952. From Central California to date this season: Oranges, 5,368; lemons, 288; total, 5,656. To same date last season: Oranges, 3,691; lemons, 251; total, 3,942. Northern California this season: Oranges, 260; lemons, 20; total, 280. To same date last season: Oranges, 234.

THE SPICE BOX OF THE WORLD

Pepper, cloves, and coffee—the fragrant kind of coffee that your mother saves for her very special guests—all come from Malaysia, the world's great spice box.

Malaysia is a land of perfume and brightness, a land of wonder and of endless change. New Guinea, the least known part of the East Indies, is the largest island in the world, and no doubt the smallest one could also be located in this region; for the face of the waters is speckled with countless islands of every size and shape. They cut up the channels of the sea with their many hidden reefs and shoals and make sailing more dangerous here than in almost any other part of the world. Then there are the "typhoons" which rise like a whirlwind and sweep across the waters, destroying everything in their path. And yet the sailor does not stay away from Malaysia. Malacca, Penang, Singapore, with their mystery and their beauty, keep calling him to return.

Some of the greatest sea stories in literature have been written about these waters—Everyland.

ECONOMIZING IN DRESS

By A. M. H.

One of the best ways of economizing in dress is to learn the art of coloring both wool and cotton goods, for when once learned, one can save many a dollar and with very little work.

When black goods has become soiled and rusty, wash clean, then dip in a weak dye made from one package, letting the cloth soak in this hot black dye for half an hour, stirring constantly. Do not let boil. Rinse well, hang out to dry, and press on the wrong side before quite dry. This method renews black goods beautifully.

If the small girl's cotton and muslin dresses are faded and outgrown, but the material is still good, rip them apart, piece out to make plenty large enough, boil in strong suds to remove the remaining color, then color any hade wanted with a good dye for cotton. Boy's waists and faded house dresses can be renewed in the same way.

To make an excellent cleaner for black goods not soiled enough to be washed put five cents worth of borax and ten cents worth of camphor gum chipped fine in a large bowl and pour in a quart of boiling water and stir vigorously. When it is cool put in a bottle. When wishing to use it pour a portion into a basin and dilute with half the quantity of cold water, and use an old tooth brush or black cloth for cleaning the goods.

Silk hose last about three times as long if they are rinsed out each time after being worn, in water softened with a little borax, as the rinsing removes the perspiration which causes the silk to rot and soon give way. And fine lingerie waists, collars and handkerchiefs last twice as long if they are put to soak in warm water softened with a little of the powder as they need no rubbing after the soaking.

To make white straw hats look like new, prepare a weak solution of warm water and oxalic acid. Lay hat on clean table and give it a vigorous rubbing with an old nail brush. Rinse well with clear water, wipe this off, scatter precipitate of sulphur all over the surface and place in the sun. When dry brush off with a stiff brush. Any old hat at all wearable may be utilized this spring, and if you have saved good trimmings you can have a satisfactory hat without any outlay of money.

I WISH I WERE SETTING OUT TO SEA

I wish I were setting out to sea,
Under an evening sky,
With the wet wind blowing against my face,
And the spray unspringing like fairy lace
As we went hurrying by.
The swing of the waves would bring me peace—
Swaying now low, now high.

I wish I were setting out to sea,
Bound for a far off shore,
And watching the twinkling coast lights glow,
Fainter and paler, as on we'd go,
Until they could show no more.
The wail of the wind would send me to sleep.
Sweeter than e'er before.

I wish I were setting out to sea,
Hearing the throbbing screw
Dim through my dreaming the whole night long,
With its low, monotonous humming song,
While the miles beyond us grew,
The sea and the wind, and the song all three,
Would gird my soul anew.—Ethel Wolff in New York Times.

MR. MARSH'S MIGHTY SWORD

BABBIE was eight years old, and Mr. Marsh, who lived in the Old Folks' Home, was 80 years young. Since the difference in their ages was zero, they understood each other well and were remarkably good friends. Mr. Marsh had explained to Babbie why he hated to live in the Home.

"It's this way, Babbie," he told her, "the Home is for the old and the poor and the weak—"

Babbie knew. "Like Uncle Peter."

Uncle Peter was the oldest and weakest of them all.

"But look at me, Ladybug"—Mr. Marsh often called her Ladyburg—"you look at me! These good victuals they have been afeeding me have put meat on my bones. If I could only get me a job now, some other chap could have my place here."

"I would be pretty lonesome, Mr. Marsh, if you went away," Babbie consoled him.

"Well, I cannot get a job," Mr. Marsh admitted ruefully, "because everybody says I'm too old. If they would give me a chance I would show them quick enough."

"I guess you would, the way you work in the garden so hard."

Mr. Marsh always smiled when he thought of his garden.

"Come and see my strawberries, Babbie. I should be ashamed to be agrumbling this way. I ought to be athanking the good Lord that I live in California where I can grub in the dirt all the year round."

For a long time after that conversation Babbie had urged her father to find a place for Mr. Marsh to work, and had even appealed to Mrs. Sallie Scott, the pretty young woman who lived in the cunning little bungalow across the street from the Home. But it was no use—until she and her brother Bob made up their scheme.

* * * * *

It was one morning about a week before Christmas, when Babbie removed the loose picket with a mighty jerk, looking around to make sure that no one saw her, and wedged her plump little body through the gap in the fence. She gave a gurgle of contentment. She was in the Old Folks' garden.

"Hello, little Ladybug," cried old Mr. Marsh, putting down his hoe and searching through his pockets. "I whittled you another pistol last night."

"Oh, goody!"

She snatched the tiny weapon he held out to her and examined it greedily. "It's grand! Why, it looks like a regular shooter.

Mr. Marsh nodded his white head. "It is a sight safer than a regular shooter." Babbie rubbed her rose petal cheek against the smooth wood and then slipped the pistol into her gingham apron pocket.

"Mr. Marsh," she wheedled, drawing her eyebrows together and establishing herself comfortably on an overturned flower pot, "let's play supposing."

"That is a fine game," agreed Mr. Marsh, picking up his hoe again. "What shall we 'spose? 'Sposing you were Little Red Riding Hood and I was—"

"No," she interrupted him. 'Supposing I had $25. You suppose first.'

"All right. I would buy six bucketfuls of pep'mint candy, and you and Bob and I would have a party."

"You are not playing so very fair," Babbie said reproachfully, "because I meant really, truly."

"Oh, excuse me, Babbie." Mr. Marsh was quite humble. "'Sposing I had that money, I would buy me a pair of shiny shoes, so as to look kinder prosperous, and I would go to visit my nephew out in Idaho, like he asked me to."

For a moment the old man's shoulders straightened, and a spark of hope lit up his faded blue eyes.

"Go on," sighed Babbie, "and then—"

"And then, by cracky! when I got there I would make myself so mighty useful they would beg me to stay."

"I know," put in Babbie hastily. "You said you would take care of the babies so his wife could go to church, and you would wipe the dishes and feed the chickens, and keep the yard as neat as neat"

Mr. Marsh fell to hoeing very hard indeed.

"But it's no use 'sposing, Babbie," he said. "You and me do not have that $25."

"Supposing," ventured Babbie, "supposing we had Bob write and tell your nephew—" "Hush, child!" Mr. Marsh's voice was quite stern. "My nephew Emmett, he does not know how as I am in a Home, and we are not agoing to tell him how poor I am. Why, when Emmett was a little boy he thought pretty near as much of me as he did of his own pa."

Babbie stared up at her friend, round eyed and wondering.

"Oh!" she said.

Mr. Marsh laughed. "There, Ladybug! Did I kinder scare you? Never mind. As I was acoming out into the garden I smelled cookies."

"Oh!"

"You had better run in and see the old ladies for a little spell."

Babbie hesitated. Those hot cookies would taste delectable. But she shook her head, putting her hand into her pocket to feel the smooth wooden pistol.

"Bob will want to see my new pistol," she explained. "Goodby, Mr. Marsh.'

And she darted through the fence and disappeared among the rose bushes in her own yard.

"Bob! Bob!" she called lustily.

In the distance a door banged, and presently, heralded by a shrill whistle, into the arbor came a boy. Like Babbie he was plump and blond and rosy.

"What did he give you this time, Babbie?"

"Another shooter, Bob. It is a dandy. Let's get them all out and count them up again." "Well, keep pretty still, if you can, Babbie. Here." Very cautiously the two children opened a box that was ostentatiously serving as a dolls' dining table and took out a collection of whittled toys.

"Here," said Bob, "here are three swords and four guns and a six shooter and three automatics, besides this new pistol and the stick ponies."

"It's 15," reported Babbie, triumphantly. "Will it be enough, Bob?" Bob chuckled. "Sure, Babbie. We will do it this afternoon. But I'll bet Mr. Marsh thinks we are regular pigs, the way we have begged these."

"Listen," hissed Babbie. "Jigger!" whispered Bob. Like a flash the whole armament was concealed in the innocent looking box.

"Aw, Babbie, it's nobody. You are such a fraid cat!"

"Bob Eldridge, I am not!" she stamped, facing him defiantly. "But if mother finds out, you know very

80 Glasses From One Package

A package of Hires Household Extract—25c at your grocer's, a yeast cake and some sugar. These will make 40 pints or 80 glasses of the best rootbeer you ever tasted. And it's so easy to make.

The actual juices of roots, barks, herbs, berries—and pure cane sugar make Hires Household Extract pure and healthful.

Our special airtight, patent bottle stoppers keep the fizz from escaping until you are ready to drink. Your grocer has them.

Be sure you get this package. It brings you the genuine Hires Household Extract.

well she will not let us sell them down on the corner, and then how will Mr. Marsh ever go to see his nephew? You tell me that!"

"Gee, Bab, no use to get so mad." Then changing the subject with great tact, "I bet you we will get more than anl old $25 for them."

Late that afternoon Ned Scott and his wife Sallie were strolling along the shady street, discussing the very interesting topic of Christmas presents. It was a very important discussion, for it was only their second Christmas to select presents for each other, and they had almost decided to put their funds together and buy something for the new little bungalow after all. A rug, or a big easy chair.

"Look, Ned," cried Mrs. Scott, stopping suddenly. "What can be the matter? Those are the little youngsters that live next door to the Old Folks' Home!"

"Are you sure, Sallie? We will have to investigate."

Slouched down in a disconsolate heap on a little wagon by the edge of the sidewalk was Bob, his hands deep in his pockets, his cap pulled rakishly over one eye. But Babbie stood stiffly beside him, a large wooden sword in her hand. Huge tears rolled down her apple cheeks, and her soft little hands were clenched.

"Bob," she said, "we have got to have that $25." The last word was a sob.

"Aw, hush up, you cry baby!" growled Bob.

"Hush up yourself. I'm not cr-crying!" sobbed Babbie, turning upon him fiercely.

"Why, hello!" called Mrs. Sallie, gaily, at this critical moment. And she knelt down on the pavement, regardless of the glory of new tailored suit, and took the weeping Babbie in her arms.

"Babbie, dear," she coaxed, "let's all go over there and eat some ice cream,"

But Bob stopped her. "We can't—we have to sell Mr. Marsh's sword first," he explained, sulkily.

Babbie nodded a quick assent.

"But why?" begged Mrs. Sallie. "What do you mean?"

"We sold the beautiful stick ponies and the guns and we have only $2.43," sobbed Babbie, "and that won't even buy a pair of shoes."

"Shoes?" repeated Mr. Sallie, glancing from Bob's stout boots to Babbie's dainty slippers.

"Shriny shoes," almost groaned Babbie, trying unsuccessfully to choke back the sobs. "He can't—look prosperous—without shiny shoes."

"They want the shoes for Mr. Marsh," guessed Ned Scott. "Does he know?"

"Nobody knows. Not mother, nor nobody."

Then they tried to explain, but Mrs. Sallie could not wait until they were through with their story. Mr. Marsh was her friend, too.

"I have found the Christmas present I want, Ned," she cried, her blue eyes dancing, although there were tears in them. "I want Mr. Marsh's sword!"

"The sword," said Bob, taking a sudden interest and trying to use a businesslike tone; "this sword is 25 cents."

"Oh, no, not so cheap, Bob. For see, it is such a beautiful sword. And it just fits my hand."

"Of course," agreed Ned Scott, smiling down at the three of them, you must mean $25."

Gravely he counted the golden coins into Babbie's plump hand and watched her, as with a sigh of relief she put them into her red pocketbook and stuffed that into Bob's pocket.

"Let's have that ice cream now, people," laughed Mrs. Sallie, pointing toward the corner drug store and waiving her sword gallantly. "Now that you know Mr. Marsh can have his prosperous shoes, perhaps you can pause to eat."

"Strawberry ice cream soda," agreed Mr. Ned Scott. "We will drink to the health of the new shoes."

"I guess," murmured Babbie, contentedly, when they were all perched on the high stools, watching the brisk, white coated boy as he handed them their glasses overflowing with luscious pink foam, "I guess, of course, Mr. Marsh will be pretty much surprised."

"Right you are Babbie," grinned Mr. Ned Scott. Then suddenly, "And, Babbie, if I were you I would not tell him what I paid for the sword. Just let him think you charged a little more for everything."

"I know," sighed Babbie, spreading a generous spoonful of cream over her face. "He would think we cheated you."

"You remember I said 25 cents, didn't I, Mrs. Scott?" reminded Bob, with his mouth very full. "I said, 'This sword'"—

"See here, young man," said Ned Scott, do you think I would give Sallie a 25 cent Christmas present?" Then he added confidentially, "Really, I had almost decided to give her a gold—piano!"

"Oh, oh!" chuckled Babbie, giving Mr. Ned Scott a rapturous albeit sticky hug, as she slipped down from her stool, "there are no gold pianos, and you are just making believe!"

* * * * *

After what seemed an eternity, but was in reality only three days, Babbie and Bob were going over to the Old Folks' Home to tell Mr. Marsh goodby. For Mr. Marsh had telegraphed to his nephew Emmett, and everything was arranged.

"I do hope," confided Babbie, just as she rang the bell; "I do hope that his shoes are awfully shiny."

"Prosperous," amended Bob, and then Mr. Marsh himself opened the door.

But though his shoes were black and very shiny, anyone could see at a glance that they were his same old shoes, with a patch on one toe, and they did not look at all prosperous.

"Oh, goodness!" gasped Babbie. "Mr. Marsh, did you forget to put on your new shoees?"

"Sh-hush," whispered Mr. Marsh, winking slyly first at her and then at Bob. "Don't say a word."

Then "Come in, come right in," he added in a very loud voice. "Everybody is acoming to see me today. Mr. and Mrs. Scott, and everybody. Coming to see me and Uncle Peter."

There sat Uncle Peter, the center of an admiring group, with his feet in gloriously brilliant tan colored shoes—shoes that were screamingly new, stretched out before him.

"But where," asked Bob, in a funny, sad little voice, "how did you get them, Uncle Peter?"

Uncle Peter chuckled softly. "I do not know. Some one found them on the door step, quite early this morning. There was a note in one of them that said 'For Uncle Peter' and a note in the other one that said 'From a very old friend' Maybe they came from Heaven." He laughed again. "I guess, most likely, Heaven sent them."

Then Mr. Marsh nudged Bob and winked again. His blue eyes were twinkling.

"Oh, Mr. Marsh," whispered Babbie, with her soft little arms around his neck, her moist, warm little mouth close to his ear, "How could you give him your prosperous shoes?"

"By Jimminy, Babbie," Mr. Marsh whispered back, smoothing her silky hair with his rough hand, isn't it a fine joke on Uncle Peter? And isn't he tickled? And come to think about it, good old patched shoes are agoing to look a sight more prosperous than such brand new ones" And he wagged his white head wisely. "You ask your pa if they don't."

"It is time for you to start," cried Mrs. Sallie, straightening Mr. Marsh's tie, and brushing an imaginary bit of dust off his coat. "Dear people, you will simply have to stop looking at Uncle Peter's beautiful shoes before your eyes wear holes in them, and tell Mr. Marsh goodby."

At that Ned Scott seized the old suit case that held all Mr. Marsh's worldly possessions, while Mr. Marsh himself, his head high and his lips smiling, walked down the path and out of the old gate, with Babbie and Bob clinging to his hands. His pockets bulged comically with odd, pathetic last minute remembrances from the other old people, but his eyes were confident, as though he already saw the little home in Idaho, and his tall nephew Emmett with his pretty young wife, begging him to stay on and on—because he had "made himself so mighty useful they did not know how they could ever get along without him!"—Successful Farming.

If a glass stopper sticks tight in a bottle, carefully expand the neck of the bottle by turning it and heating it gradually in a small flame, say a piece of kindling wood.

READY NOW!

ADVANCE SUMMER ISSUE

Barker Bros.' General Catalog of Furniture and Home Furnishings

The largest catalog ever issued by Barker Bros., and containing the most extensive and complete representation of this store's magnificent stocks of home furnishing goods ever compiled.

Profusely illustrated with the finest of photographic reproductions showing the true proportions of the goods pictured. The book is designed as a comprehensive guide to successful home furnishings. It is an accurate compilation of the many beautiful and useful things needed to make homes better. It shows you how easily you can trade with Barker Bros., no matter how far away you live, through the helpful service of Barker Bros.' Mail Order Department.

FREE ON REQUEST

This catalog is a beautiful book of 136 pages, enclosed in cover printed in four colors, the highest type of the printing art. It is sent FREE but only on request as it is our wish that it reach those interested in making their homes better. Just send a note or postal saying,

"Please send me your new Catalog"

and it will be mailed you FREE with our compliments.

722 South Broadway — Barker Bros. ESTABLISHED-1880 — Los Angeles California

Furnishers of Successful Homes

THE HOMIEST HOME

By Subscriber, Riverside

It seems to me there is something hardly definable in the matter of what constitutes the homiest home. There are so many things that minister to our comfort and convenience, so many that minister to our love for the beautiful in nature and in art, that, given the proper atmosphere that should be in every home, and lacking this atmosphere it is only a place to stay, but if there is one thing in our home we would part with last it would be the couch. There the tired man can rest for a few minutes at the noon hour, the weary housewife find a few minutes of rest and refreshment; the grandchildren when tired of romping and play drop down to get their breath; and the dear baby take his nap instead of being put away in a cold room when he comes to visit his "Bama."

I cast my vote for the dear old comfort, the couch.

THE KEY TO THE HEART

By Franklin Anderson, Santa Barbara

To me the piano is the homiest thing. It always has some cheerful music. When we come in from our day's toil we feel tired out and the piano seems to strengthen us up so we can go to bed with a happy feeling in our minds. It seems also that we have happier dreams in our sleep. On Sunday it is useful for church songs and also evenings when the family gather around it and sing some cheerful and lively songs. Music is the key to the heart.

THIS WEEK'S PATTERNS

The first gown shown is a charming style for a foulard or figured voile, so popular this year. A fine organdie collar with simple embroidery may be made detachable and kept freshly laundered and dainty at all times.

3256-2746—Note this requires two patterns, each ten cents, equally suitable for a gingham or lawn or for a sport silk. The fluted ruffle on the long, graceful collar and cuffs gives the last touch of daintiness.

The girls' dress, 2911, with kilted skirt, is just the thing for a beach outing or vacation trip. Made of substantial wool, it will save laundering and give good service in cool climates. Of Devonshire, Kindergarten or similar firm cotton weave, it will be suitable for warm days. Where mother has time to give it the care, a white wool would be the very loveliest ever.

3258 is pattern of a simple night dress which one should always have on hand.

The forehanded woman who starts making Christmas gifts in the summer vacation days will see the possibilities in apron pattern 3254. It has uncommonly graceful and quaint lines and is made for service. The good old substantial rickrack edging is popular again and very dainty in effect.

The little boy's suit, 3272, is very new in effect and the little girl's dress, 2924, is as lovely as it is simple. The ducky little pockets make its charm and will make any small girl's heart happy.

BEAN RECIPES

Bean Loaf

4 cups cooked beans, 1 cup strained cooked tomatoes, 1 cup dry bread crumbs, 1 well beaten egg, 1 minced onion, 1 teaspoon chopped parsley.

Beans must be well cooked and thoroughly drained. Press through sieve and mix with other ingredients. Salt and pepper to taste. Place in a well greased roasting tin and allow to cook for ten minutes in moderately hot oven; then add one tablespoon butter and a half cup of hot water, basting frequently during a half hour's cooking. The loaf should be well browned. Served with tomato sauce.

Chile Con Carne and Beans

½ pound pink beans, ⅛ teaspoon soda, ¼ pound well seasoned hamburg steak or chopped left over meat, 1½ teaspoon salt, 1 clove garlic or 1 chopped onion, small slice fat pork, 1 tablespoon flour, ½ cup chopped canned green chile, 1 can tomato sauce.

Soak beans over night and in morning add salt and soda and boil until beans are tender. Cut pork into small pieces and fry until fat is tried out; add steak or left over meat, sprinkle with flour and brown. Add chopped chile, tomato sauce, onion or garlic and one cup of water. Bake in moderate oven for one hour, adding more water if necessary.

Spanish Beans No. 2

1 quart kidney beans, 1 quart tomatoes, 1 clove garlic, 2 tablespoons Spanish pepper, ¼ teaspoon tabasco sauce, 1 pound cooked pickled pork, 2 large onions, ½ can pimentos, ¼ teaspoon nutmeg, 2 tablespoons sugar.

Soak the kidney beans over night and boil until tender. Add the pickled pork, which has been previously cooked, and put through grinder. Add tomatoes, onions chopped fine, garlic and chopped pimentos, Spanish pepper, tabasco sauce, nutmeg, sugar and salt to taste. Bake in moderate oven four hours.

Bean Souffle

1 pint hot boiled bean pulp, 1 teaspoon onion juice, 2 eggs, 2 tablespoons finely chopped parsley.

Beat yolk of egg and add to above ingredients. Fold in the well beaten whites of the eggs. Heap mixture lightly in a baking dish. Bake in slow oven for about 20 minutes, or until it is set. Serve immediately.

Bean Crust

One cup boiled pink beans, 1 teaspoon baking powder, 2 tablespoons melted fat, ½ teaspoon salt, 1 egg, flour to make soft dough.

Combine above and roll out mixture to about one-eighth inch thick on well floured board. Cut strips of suitable size when folded for individual pies. Fill pies with chopped cooked meat or vegetables. Fold crust over and press along edges. Bake in moderate oven until well browned.

BABY TEETH SHOULD NOT BE PULLED

Milk teeth or baby teeth are cut between six months and three years of age. These teeth should be left in as good condition as possible, if for no other reason, for the effect on the permanent teeth which follow. The roots of the milk teeth are absorbed, and the material used for strengthening the permanent teeth growing beneath. They should not be pulled until loosened by the growing tooth beneath. Teething is no longer considered a factor of disease. It may cause fretfulness but never serious stomach or intestinal trouble or convulsions.

LIKED HER MOTHER

Six year old Margaret often played with Nellie, a neighbor's little girl. One rainy day the two were just starting across the clean kitchen floor at Margaret's home when the latter's mother, seeing their muddy shoes, headed them off and sent them out to play on the porch. After a moment Nellie remarked:

"My mother don't care how much I run over the kitchen floor."

There was quite a long interval of silence. Then Margaret said:

"I wish I had a nice, dirty mother like you've got, Nellie."—Galveston News.

AFTER MANY TRIALS

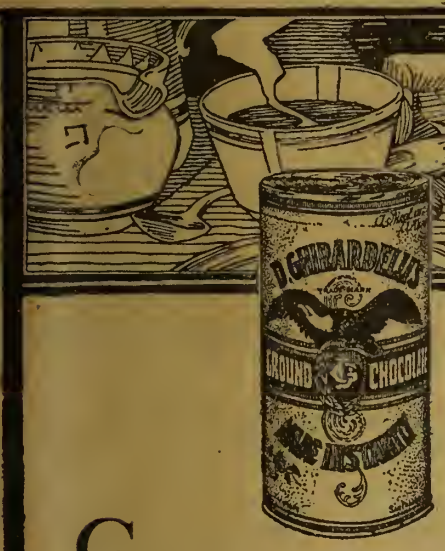
"He took my ball," said a youngster when reproved for fighting with another boy.

"Did you try to get it from him peaceably?"

"Yes'm."

"How many times did you try?"

"I tried once, twice thrice and force, and I didn't get it until the last time."—Boston Transcript.



GETTING breakfast isn't the tedious job it used to be, thanks to modern conveniences—and Ghirardelli's Ground Chocolate. Besides, the "Ghirardelli breakfast" is not only much easier to prepare, but it's also more wholesome, more nutritious, more sustaining! Ghirardelli's is food and drink both!

Never sold in bulk—but in cans only.
In ½ lb., 1 lb. and 3 lb. sealed cans—
at the store where you do your trading.

Say "Gear-ar-delly"

D. GHIRARDELLI CO.

Since 1852 San Francisco

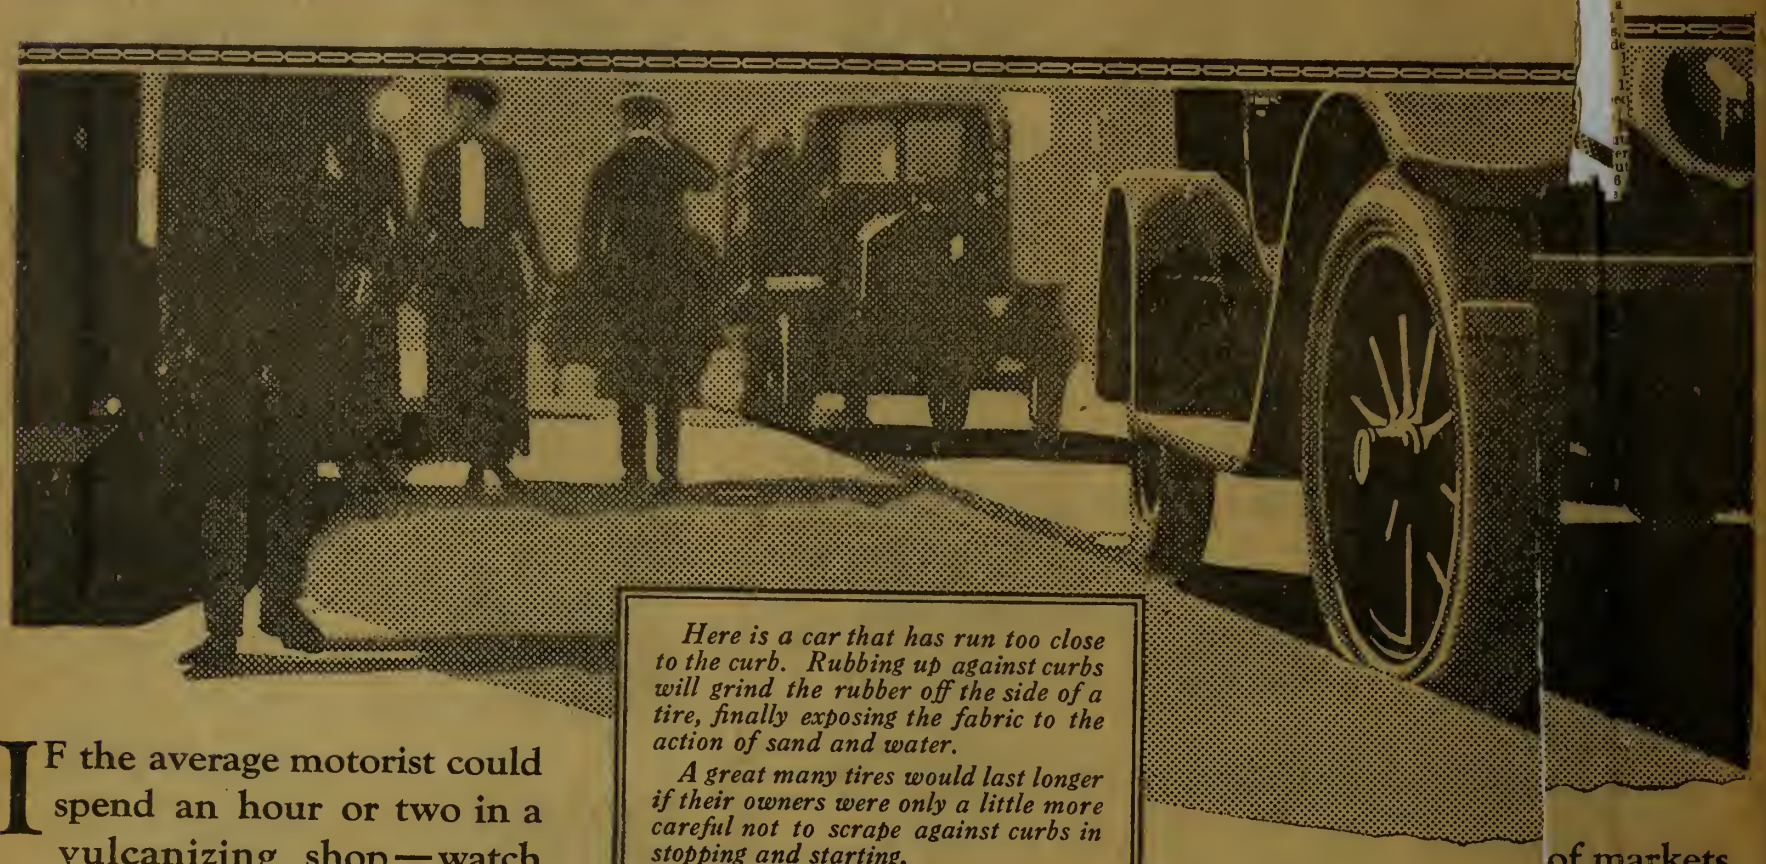
Forty million tires for 19[illegible]20 What kind of tires are th[illegible]ey



Here is a car that has run too close to the curb. Rubbing up against curbs will grind the rubber off the side of a tire, finally exposing the fabric to the action of sand and water.

A great many tires would last longer if their owners were only a little more careful not to scrape against curbs in stopping and starting.

IF the average motorist could spend an hour or two in a vulcanizing shop—watch the tires coming in for repair with all their weaknesses showing—talk to the shop manager away from the cheers of the tire salesmen—

He would see what comes of thinking too much in terms of "concessions" and "allowances."

* * *

Concessions and allowances are what the irresponsible tire dealer lives on.

He finds it easier to convince a man that he will make good on a tire if it goes bad than to convince him that it won't go bad.

What practical motorists are looking for today is good tires —not tires that may have to be made good.

And they are going more and more to the dealer whose business is based on *quality* instead of on chance.

* * *

The United States Rubber Company stands back of that kind of a dealer with all the tremendous resources at its command.

It has staked a larger investment on quality than any other rubber organization. Its first thought has always been of the tire user—putting his problem before the problem [illegible]of markets.

Every important [illegible]advance in tire manufacture has [illegible]come from the United States Ru[illegible]bber Company—the *first straigh[illegible] pneumatic* mobile tire, the *first [illegible]less rubber* truck tire, the *grain[illegible]* [illegible]nstance. solid truck tire, for i[illegible]

[illegible]tee is for The U. S. guaran[illegible]d not for the *life of the tire,* an[illegible] a limited mileage.

* * *

Nearly every man [illegible] pays for U. S. Tire quality, [illegible] but he doesn't always get it.

If he did the country's t[illegible] [illegible]wouldn't need forty million tire[illegible] is year.
